```
Special Values

Condition

• exp = 111...1

Cases

• exp = 111...1, frac = 000...0

• Represents value \infty (infinity)

• Operation that overflows

• Both positive and negative

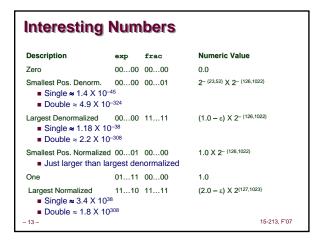

• E.g., 1.0/0.0 = -1.0/-0.0 = +\infty, 1.0/-0.0 = -\infty

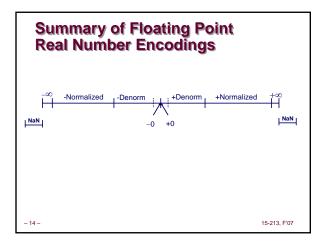

• exp = 111...1, frac \neq 000...0

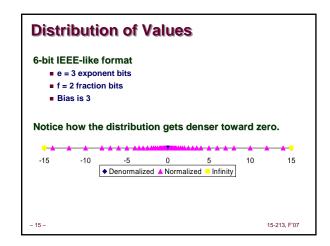

• Not-a-Number (NaN)

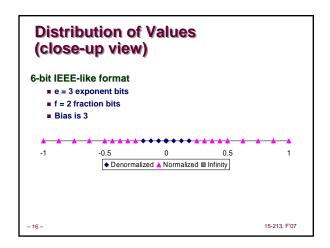

• Represents case when no numeric value can be determined

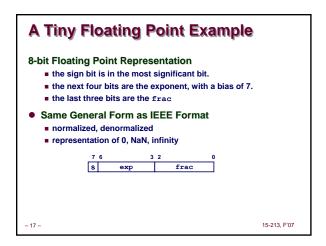

• E.g., sqrt(-1), \infty - \infty, \infty * 0
```

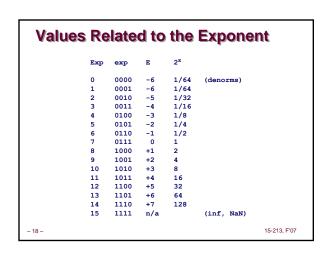

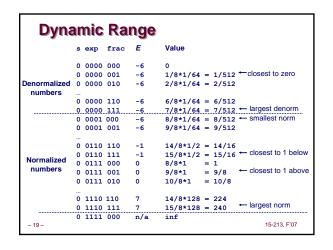

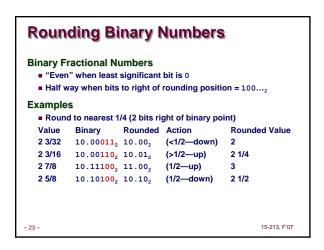

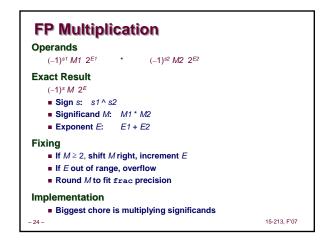

Special Properties of IEEE Encoding FP Zero Same as Integer Zero = All bits = 0 Can (Almost) Use Unsigned Integer Comparison = Must first compare sign bits = Must consider -0 = 0 = NaNs problematic = Will be greater than any other values = What should comparison yield? = Otherwise OK = Denorm vs. normalized = Normalized vs. infinity

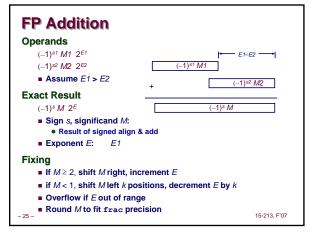

15-213, F'07

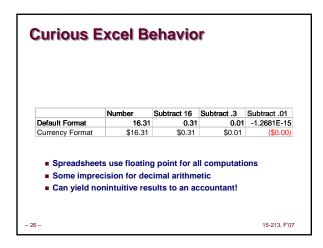

Floating Point Operations **Conceptual View** ■ First compute exact result ■ Make it fit into desired precision Possibly overflow if exponent too large • Possibly round to fit into frac Rounding Modes (illustrate with \$ rounding) \$1.40 \$1.60 \$1.50 \$2.50 -\$1.50 ■ Zero \$1 \$1 \$1 \$2 -\$1 -\$2 ■ Round down (-∞) \$1 \$2 \$1 \$1 ■ Round up (+∞) \$2 \$2 \$3 -\$1 ■ Nearest Even (default) \$1 \$2 -\$2 \$2 \$2 1. Round down: rounded result is close to but no greater than true result. Round up: rounded result is close to but no less than true result. 15-213, F07

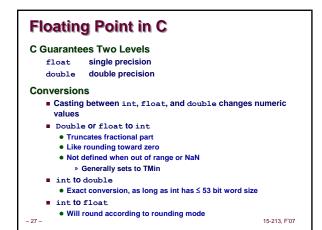

Closer Look at Round-To-Even **Default Rounding Mode** ■ Hard to get any other kind without dropping into assembly ■ All others are statistically biased Sum of set of positive numbers will consistently be over- or under-Applying to Other Decimal Places / Bit Positions ■ When exactly halfway between two possible values •Round so that least significant digit is even ■ E.g., round to nearest hundredth 1.2349999 1.23 1.2350001 1.24 (Less than half way) (Greater than half way) 1.2350000 1.24 (Half way-round up) 1.2450000 1.24 (Half way-round down) - 22 -15-213, F'07

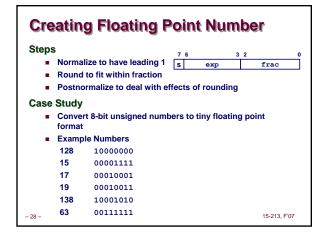

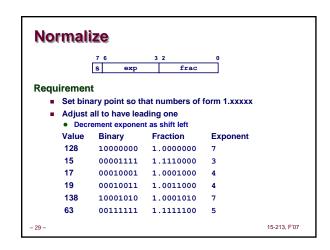

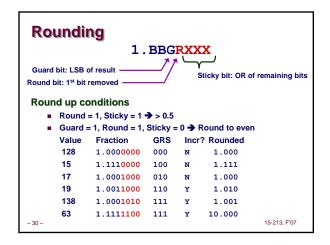

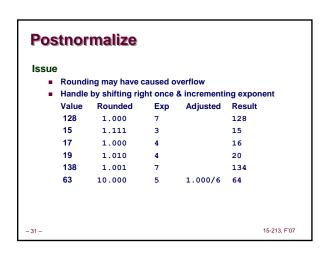

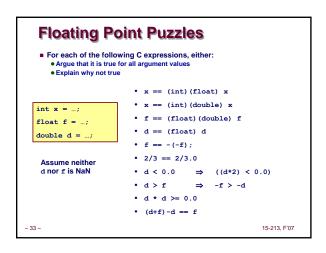

Summary IEEE Floating Point Has Clear Mathematical Properties Represents numbers of form M × 2^E Can reason about operations independent of implementation As if computed with perfect precision and then rounded Not the same as real arithmetic Violates associativity/distributivity Makes life difficult for compilers & serious numerical applications programmers

Mathematical Properties of FP Add Compare to those of Abelian Group ■ Closed under addition? • But may generate infinity or NaN ■ Commutative? YES ■ Associative? NO Overflow and inexactness of rounding ■ 0 is additive identity? ■ Every element has additive inverse ALMOST • Except for infinities & NaNs Monotonicity AL MOST $\blacksquare a \ge b \Rightarrow a+c \ge b+c$? Except for infinities & NaNs - 34 -15-213, F'07
