

# Lecture 13

## Introduction to

### Static Single Assignment (SSA)

(Slides courtesy of Seth Goldstein.)

Todd C. Mowry

15-745: Intro to SSA

Carnegie Mellon

1

### Values ≠ Locations

```
...
for (i=0; i++; i<10) {
    ... = ... i ...
}
for (i=j; i++; i<20) {
    ... = i ...
}
```

Def-use chains help solve the problem.

15-745: Intro to SSA

2

Carnegie Mellon

Todd C. Mowry

### Def-Use Chains are Expensive

```
foo(int i, int j) {
    ...
    switch (i) {
        case 0: x=3; break;
        case 1: x=1; break;
        case 2: x=6; break;
        case 3: x=7; break;
        default: x = 11;
    }
    switch (j) {
        case 0: y=x1; break;
        case 1: y=x+4; break;
        case 2: y=x-2; break;
        case 3: y=x+1; break;
        default: y=x+9;
    }
    ...
}
```

In general,  
 $N$  defs  
 $M$  uses  
 $\Rightarrow O(NM)$  space and time

One solution: limit each variable to ONE definition site

15-745: Intro to SSA

Carnegie Mellon

Todd C. Mowry

### Def-Use Chains are Expensive

```
foo(int i, int j) {
    ...
    switch (i) {
        case 0: x=3; break;
        case 1: x=1; break;
        case 2: x=6;
        case 3: x=7;
        default: x = 11;
    }
    xl is one of the above x's
    switch (j) {
        case 0: y=x1+7;
        case 1: y=x1+4;
        case 2: y=x1-2;
        case 3: y=x1+1;
        default: y=x1+9;
    }
    ...
}
```

One solution: limit each variable to ONE definition site

15-745: Intro to SSA

4

Carnegie Mellon

Todd C. Mowry

## Advantages of SSA

- Makes du-chains explicit
- Makes dataflow analysis easier
- Improves register allocation
  - Automatically builds "webs"
  - Makes building interference graphs easier
- For most programs reduces space/time requirements

15-745: Intro to SSA

5

Carnegie Mellon  
Todd C. Mowry

## SSA

- Static single assignment is an IR where **every variable is assigned a value at most once** in the program text
- Easy for a basic block:
  - assign to a fresh variable at each stmt.
  - each use uses the most recently defined var.
  - (Similar to Value Numbering)

15-745: Intro to SSA

6

Carnegie Mellon  
Todd C. Mowry

## Straight-line SSA

```
a ← x + y          a1 ← x + y
b ← a + x          b1 ← a1 + x
a ← b + 2          a2 ← b1 + 2
c ← y + 1          c1 ← y + 1
a ← c + a          a3 ← c1 + a2
```

15-745: Intro to SSA

7

Carnegie Mellon  
Todd C. Mowry

## SSA

- Static single assignment is an IR where **every variable is assigned a value at most once** in the program text
- Easy for a basic block:
  - assign to a fresh variable at each stmt.
  - each use uses the most recently defined var.
  - (Similar to Value Numbering)
- What about at joins in the CFG?

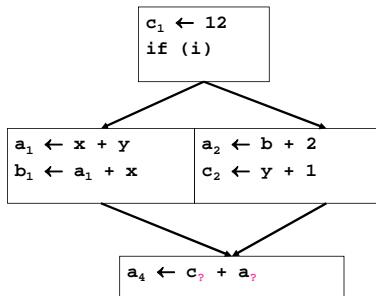

15-745: Intro to SSA

8

Carnegie Mellon  
Todd C. Mowry

### Merging at Joins

```
c ← 12
if (i) {
    a ← x + y
    b ← a + x
} else {
    a ← b + 2
    c ← y + 1
}
a ← c + a
```

15-745: Intro to SSA

9

Carnegie Mellon  
Todd C. Mowry

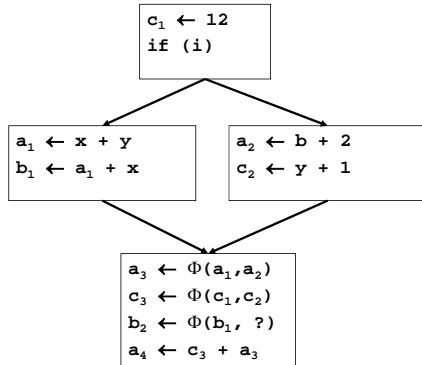

### SSA

- Static single assignment is an IR where every variable is assigned a value at most once in the program text
- Easy for a basic block:
  - assign to a fresh variable at each stmt.
  - Each use uses the most recently defined var.
  - (Similar to Value Numbering)
- What about at joins in the CFG?
  - Use a notational fiction: a  $\Phi$  function

Carnegie Mellon  
Todd C. Mowry

10

### Merging at Joins

15-745: Intro to SSA

11

Carnegie Mellon  
Todd C. Mowry

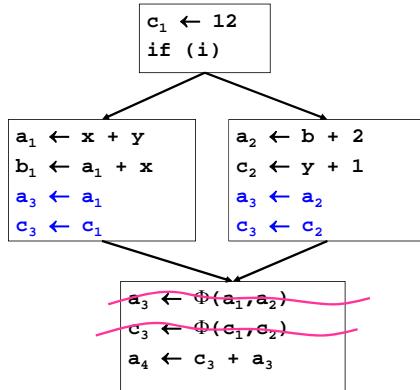

### The $\Phi$ function

- $\Phi$  merges multiple definitions along multiple control paths into a single definition.
- At a basic block with  $p$  predecessors, there are  $p$  arguments to the  $\Phi$  function.
 
$$x_{\text{new}} \leftarrow \Phi(x_1, x_1, x_1, \dots, x_p)$$
- How do we choose which  $x_i$  to use?
  - We don't really care!
  - If we care, use moves on each incoming edge

Carnegie Mellon  
Todd C. Mowry

12

### "Implementing" $\Phi$

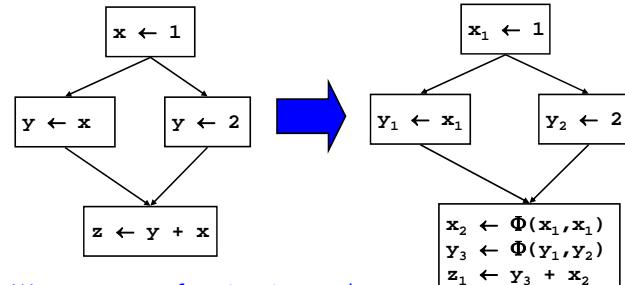

15-745: Intro to SSA

13

Carnegie Mellon Todd C. Mowry

### Trivial SSA

- Each assignment generates a fresh variable.
- At each join point insert  $\Phi$  functions for **all live variables**.

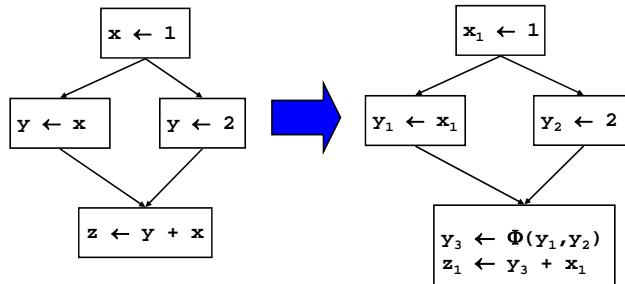

15-745: Intro to SSA

14

Carnegie Mellon Todd C. Mowry

### Minimal SSA

- Each assignment generates a fresh variable.
- At each join point insert  $\Phi$  functions for **all live variables with multiple outstanding defs.**

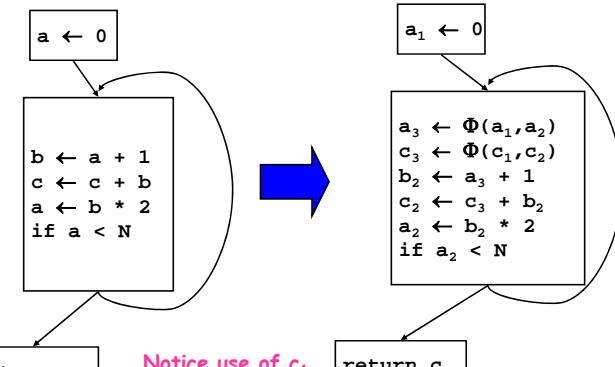

15-745: Intro to SSA

15

Carnegie Mellon Todd C. Mowry

### Another Example

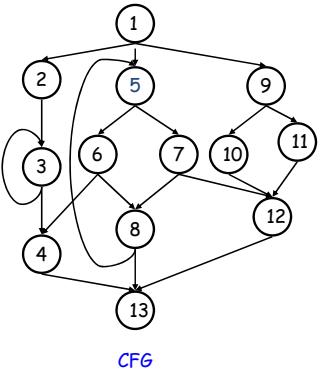

15-745: Intro to SSA

16

Carnegie Mellon Todd C. Mowry

### When Do We Insert $\Phi$ ?

If there is a def of  $a$  in block 5, which nodes need a  $\Phi()$ ?

15-745: Intro to SSA

17

Carnegie Mellon  
Todd C. Mowry

### When do we insert $\Phi$ ?

- We insert a  $\Phi$  function for variable  $A$  in block  $Z$  iff:
  - $A$  was defined more than once before
    - (i.e.,  $A$  defined in  $X$  and  $Y$  AND  $X \neq Y$ )
  - There exists a non-empty path from  $x$  to  $z$ ,  $P_{xz}$ , and a non-empty path from  $y$  to  $z$ ,  $P_{yz}$ , s.t.
    - $P_{xz} \cap P_{yz} = \{ z \}$
    - $z \notin P_{xq}$  or  $z \notin P_{yr}$  where  $P_{xz} = P_{xq} \rightarrow z$  and  $P_{yz} = P_{yr} \rightarrow z$
- Entry block contains an implicit def of all vars
- Note:  $A = \Phi(\dots)$  is a def of  $A$

15-745: Intro to SSA

18

Carnegie Mellon  
Todd C. Mowry

### Dominance Property of SSA

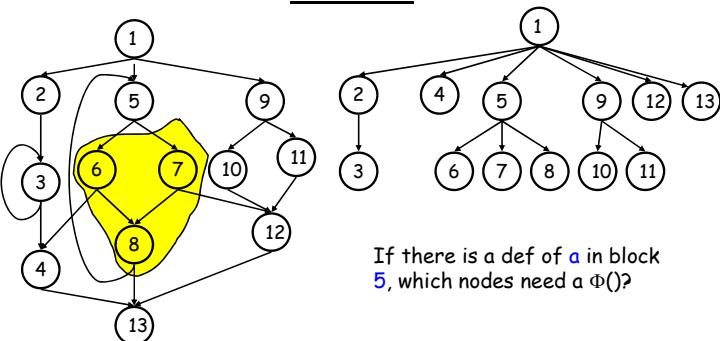

- In SSA, definitions dominate uses.
  - If  $x_i$  is used in  $x \leftarrow \Phi(\dots, x_i, \dots)$ , then  $BB(x_i)$  dominates  $i^{\text{th}}$  predecessor of  $BB(\text{PHI})$
  - If  $x$  is used in  $y \leftarrow \dots x \dots$ , then  $BB(x)$  dominates  $BB(y)$
- We can use this for an efficient algorithm to convert to SSA

15-745: Intro to SSA

19

Carnegie Mellon  
Todd C. Mowry

### Dominance

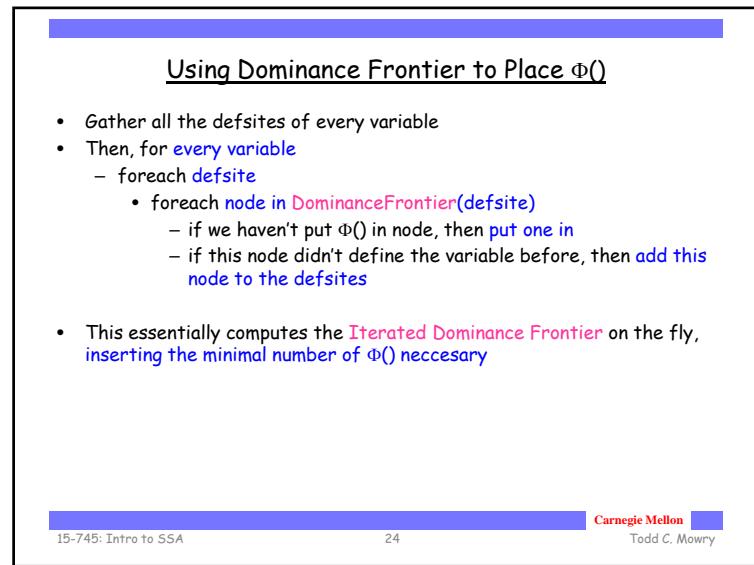

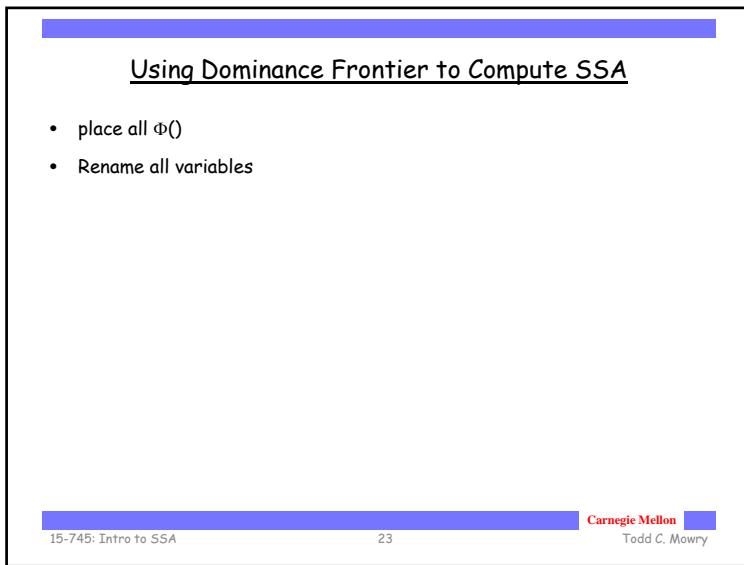

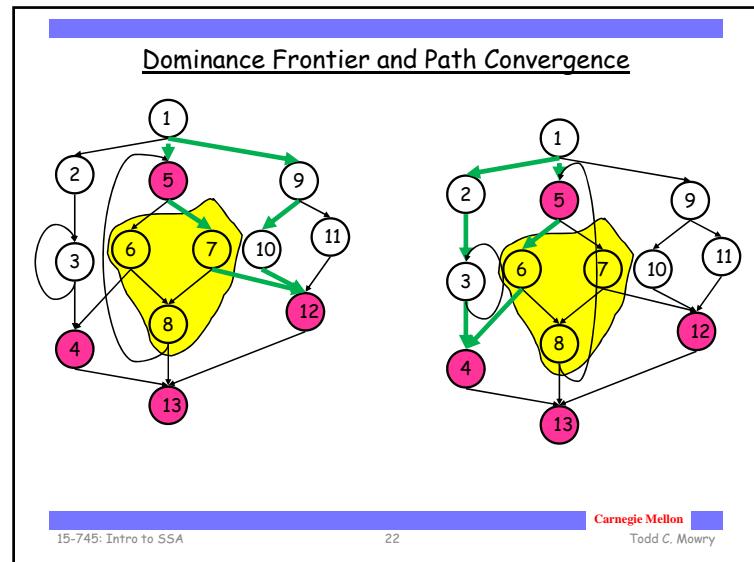

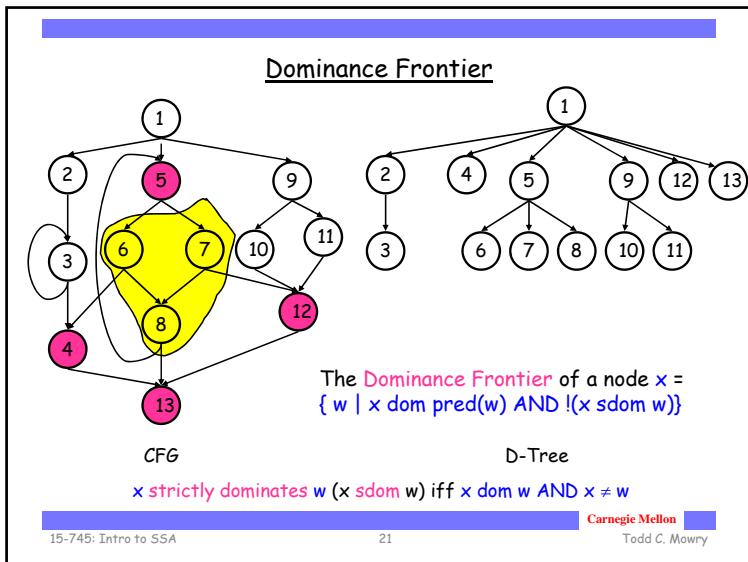

$x$  strictly dominates  $w$  ( $x \text{ sdom } w$ ) iff  $x \text{ dom } w$  AND  $x \neq w$

15-745: Intro to SSA

20

Carnegie Mellon  
Todd C. Mowry

## Using Dominance Frontier to Place $\Phi()$

```

foreach node n {
    foreach variable v defined in n {
        orig[n] ∪= {v}
        defsites[v] ∪= {n}
    }
}
foreach variable v {
    W = defsites[v]
    while W not empty {
        n = remove node from W
        foreach y in DF[n]
            if y ∉ PHI[v] {
                insert "v ← Φ(v,v,...)" at top of y
                PHI[v] = PHI[v] ∪ {y}
                if v ∉ orig[y]: W = W ∪ {y}
            }
    }
}

```

15-745: Intro to SSA

25

Carnegie Mellon

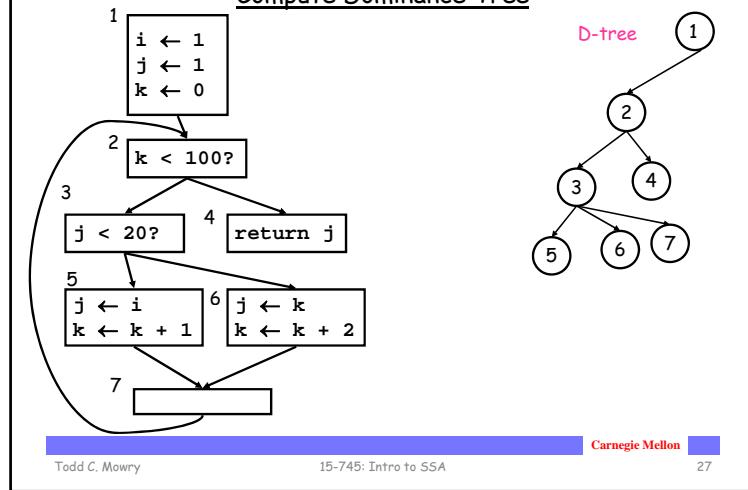

- Algorithm:
    - Walk the D-tree, renaming variables as you go
    - Replace uses with more recent renamed def
  - For straight-line code this is easy
  - What if there are branches and joins?
    - use the **closest def such that the def is above the use in the D-tree**
  - Easy implementation:
    - for each var: **rename (v)**
    - **rename(v):** replace uses with top of stack
      - at def: push onto stack
      - call **rename(v)** on all children in D-tree
      - for each def in this block pop from stack

15-745: Intro to SSA

1

Carnegie Mellon

## Compute Dominance Tree

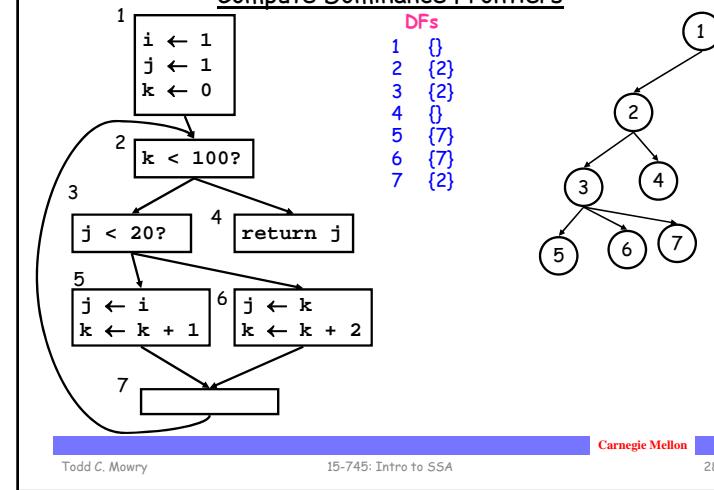

Todd C. Mowry

15-745: Intro to SSA

1

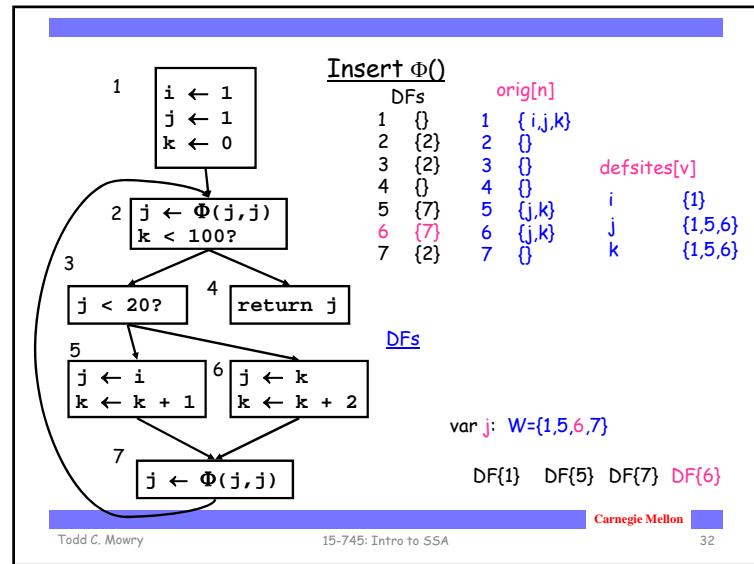

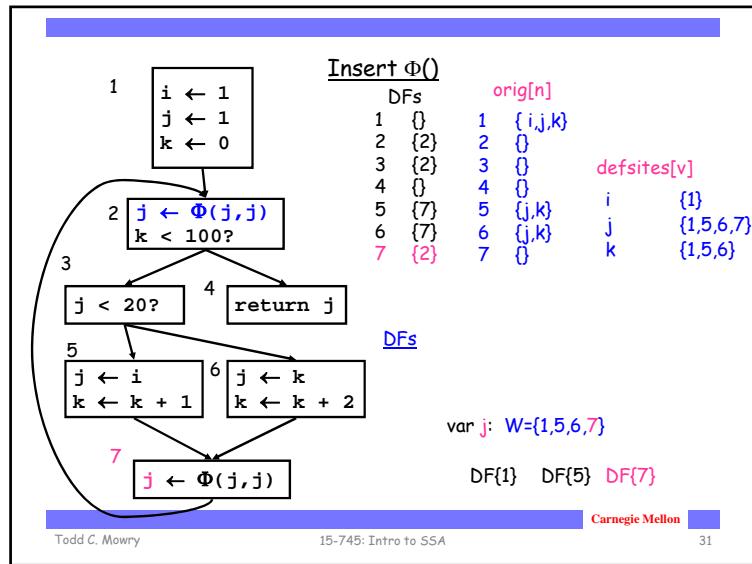

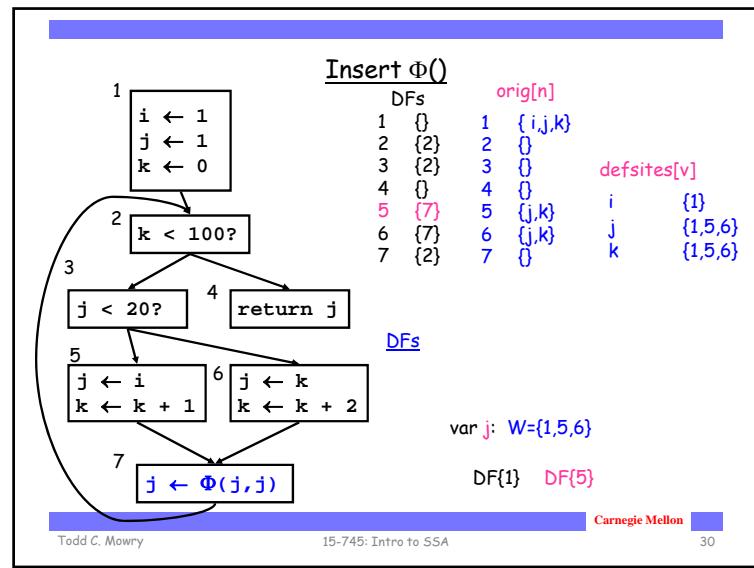

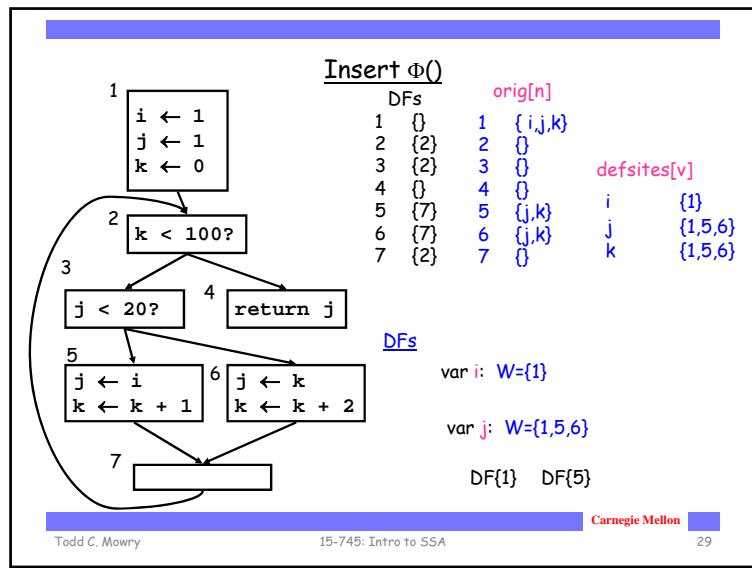

## Compute Dominance Frontiers

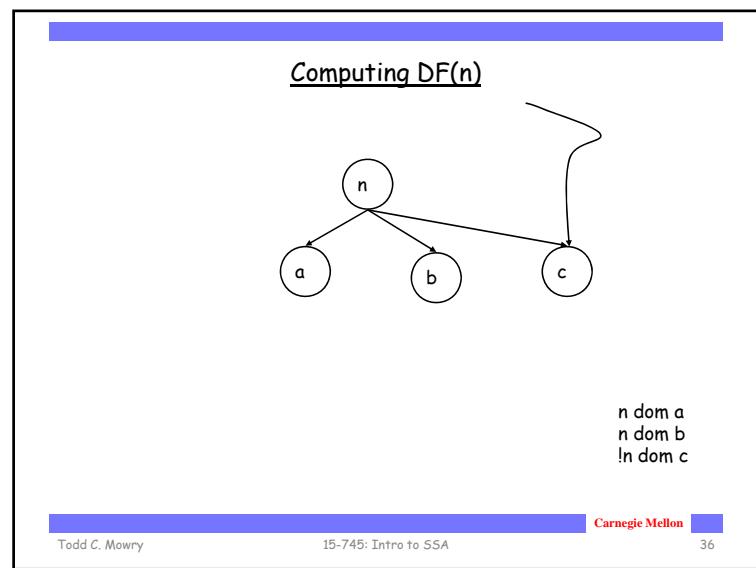

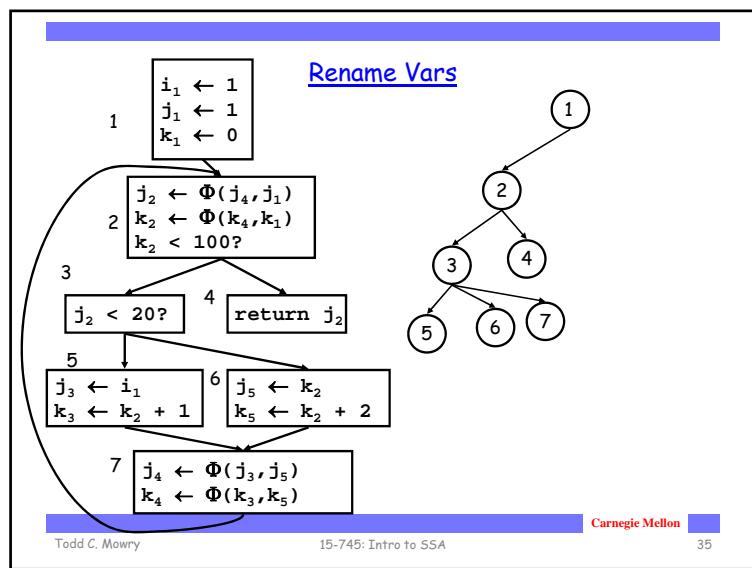

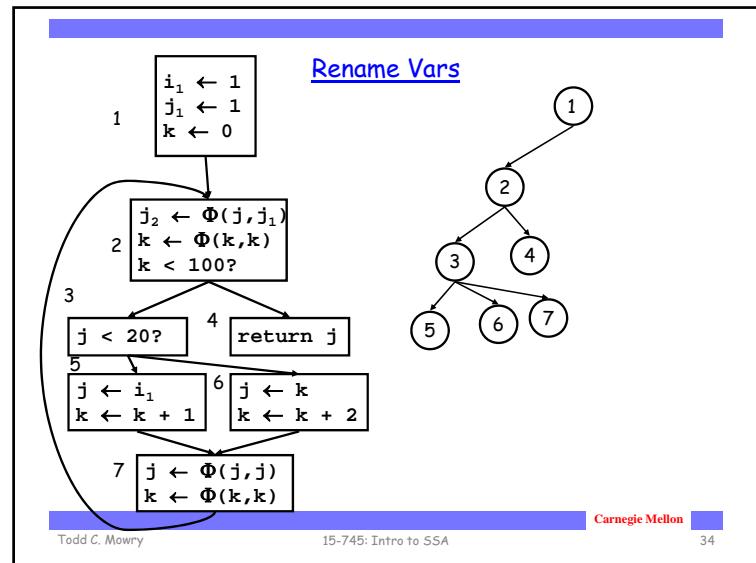

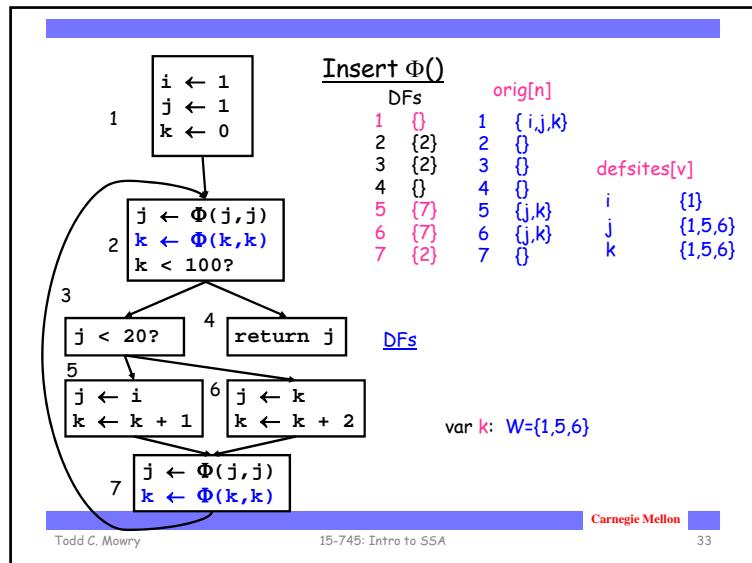

Todd C. Mowry

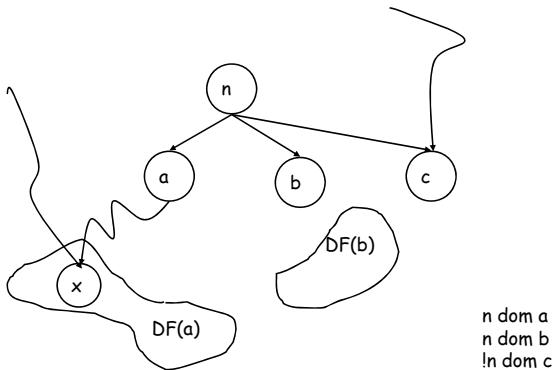

15-745: Intro to SSA

28

### Computing DF(n)

Todd C. Mowry

15-745: Intro to SSA

Carnegie Mellon

37

### Computing the Dominance Frontier

```
compute-DF(n)
  S = {}
  foreach node y in succ[n]
    if idom(y) ≠ n
      S = S ∪ {y}
  foreach child of n, c, in D-tree
    compute-DF(c)
    foreach w in DF[c]
      if !n dom w
        S = S ∪ {w}
  DF[n] = S
```

The Dominance Frontier of a node  $x$  =  
 $\{ w \mid x \text{ dom pred}(w) \text{ AND } !(x \text{ sdom } w) \}$

Todd C. Mowry

15-745: Intro to SSA

Carnegie Mellon

38

### SSA Properties

- Only 1 assignment per variable
- Definitions dominate uses

15-745: Intro to SSA

39

Carnegie Mellon  
Todd C. Mowry
