Carnegie Mellon

1

I. Example of DoAll Loops

- **Machine:**
 - Per clock: 1 read, 1 write, 1 (2-stage) arithmetic op, with hardware loop op and auto-incrementing addressing mode.
- **Source code:**

```
For i = 1 to n
    D[i] = A[i] * B[i] + c
```
- **Code for one iteration:**
 1. LD R5,0(R1++)
 2. LD R6,0(R2++)
 3. MUL R7,R5,R6
 - 4.
 5. ADD R8,R7,R4
 - 6.
 7. ST 0(R3++) ,R8
- **Little or no parallelism within basic block**

15-745: Software Pipelining

2

Carnegie Mellon

Todd C. Mowry

Loop Unrolling

```

1. L: LD
2. LD
3. LD
4. MUL LD
5. MUL LD
6. ADD LD
7. ADD LD
8. ST MUL LD
9. MUL
10. ST ADD
11. ADD
12. ST
13. ST BL (L)

```

Schedule after unrolling by a factor of 4

- Let u be the degree of unrolling:
 - Length of u iterations = $7+2(u-1)$
 - Execution time per source iteration = $(7+2(u-1)) / u = 2 + 5/u$

15-745: Software Pipelining

3

Carnegie Mellon
Todd C. Mowry

Software Pipelined Code

```

1. LD
2. LD
3. MUL LD
4. LD
5. MUL LD
6. ADD LD
7. MUL LD
8. ST ADD LD
9. MUL LD
10. ST ADD LD
11. MUL ...
12. ST ADD ...
13. ...
14. ST ADD ...
15. ...
16. ST

```

- Unlike unrolling, software pipelining can give optimal result.
- Locally compacted code may not be globally optimal
- DOALL: Can fill arbitrarily long pipelines with infinitely many iterations

15-745: Software Pipelining

4

Carnegie Mellon
Todd C. Mowry

Example of DoAcross Loop

Loop:

```
Sum = Sum + A[i];
B[i] = A[i] * c;
```

1. LD
2. MUL
3. ADD
4. ST

Software Pipelined Code

1. LD
2. MUL
3. ADD LD
4. ST MUL
5. ADD
6. ST

Doacross loops

- Recurrences can be parallelized
- Harder to fully utilize hardware with large degrees of parallelism

15-745: Software Pipelining

5

Carnegie Mellon
Todd C. Mowry

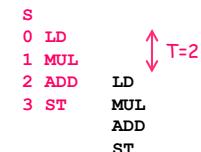

II. Problem Formulation

Goals:

- maximize throughput
- small code size

Find:

- an identical relative schedule $S(n)$ for every iteration
 - a constant initiation interval (T)
- such that
- the initiation interval is minimized

Complexity:

- NP-complete in general

Carnegie Mellon
Todd C. Mowry

15-745: Software Pipelining

6

Impact of Resources on Bound on Initiation Interval

- Example: Resource usage of 1 iteration
 - (assume machine can execute 1 LD, 1 ST, 2 ALU per clock)

LD, LD, MUL, ADD, ST

- Lower bound on initiation interval?

for all resource i ,
 number of units required by one iteration: n_i
 number of units in system: R_i

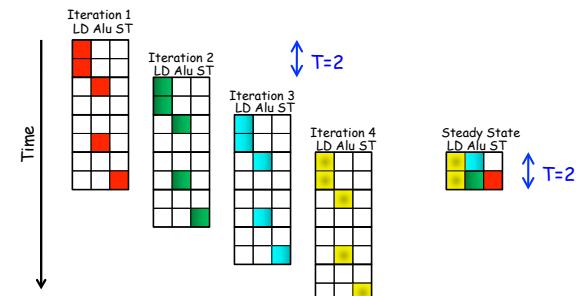

Lower bound due to resource constraints: $\max_i n_i / R_i$

15-745: Software Pipelining

7

Carnegie Mellon
Todd C. Mowry

Scheduling Constraints: Resources

- RT: resource reservation table for single iteration
- RT_s: modulo resource reservation table

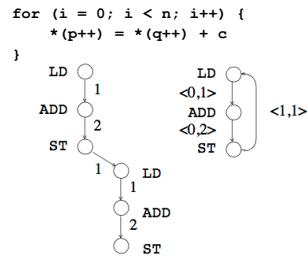

$$RT_s[i] = \sum_{t \mid (t \bmod T = i)} RT[t]$$

Carnegie Mellon
Todd C. Mowry

15-745: Software Pipelining

8

Scheduling Constraints: Precedence

- Minimum initiation interval?
- $S(n)$: schedule for n with respect to the beginning of the schedule
- Label edges with $\langle \delta, d \rangle$
 - δ = iteration difference, d = delay

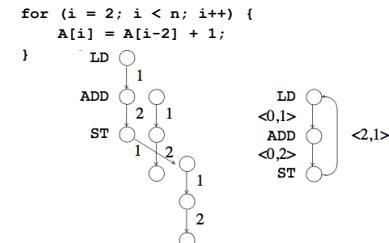

$$\delta \times T + S(n_2) - S(n_1) \geq d$$

15-745: Software Pipelining

9

Carnegie Mellon
Todd C. Mowry

Scheduling Constraints: Precedence

- Minimum initiation interval?
- $S(n)$: schedule for n with respect to the beginning of the schedule
- Label edges with $\langle \delta, d \rangle$
 - δ = iteration difference, d = delay

$$\delta \times T + S(n_2) - S(n_1) \geq d$$

15-745: Software Pipelining

10

Carnegie Mellon
Todd C. Mowry

Minimum Initiation Interval

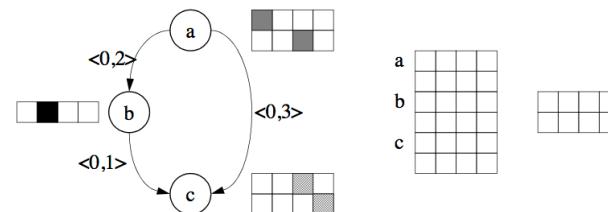

For all cycles c ,
 $\max_c \text{CycleLength}(c) / \text{IterationDifference}(c)$

15-745: Software Pipelining

11

Carnegie Mellon
Todd C. Mowry

III. Example: An Acyclic Graph

15-745: Software Pipelining

12

Carnegie Mellon
Todd C. Mowry

Algorithm for Acyclic Graphs

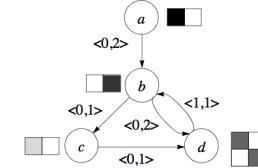

- **Find lower bound of initiation interval: T_0**
 - based on resource constraints
- **For $T = T_0, T_0+1, \dots$ until all nodes are scheduled**
 - For each node n in topological order
 - s_0 = earliest n can be scheduled
 - for each $s = s_0, s_0+1, \dots, s_0+T-1$
 - if $\text{NodeScheduled}(n, s)$ break;
 - if n cannot be scheduled break;
- **NodeScheduled(n, s)**
 - Check resources of n at s in modulo resource reservation table
- Can always meet the lower bound if:
 - every operation **uses only 1 resource**, and
 - **no cyclic dependences** in the loop

15-745: Software Pipelining

13

Carnegie Mellon
Todd C. Mowry

Cyclic Graphs

- No such thing as "topological order"
- $b \rightarrow c; c \rightarrow b$

$$S(c) - S(b) \geq 1$$

$$T + S(b) - S(c) \geq 2$$
- Scheduling b constrains c , and vice versa

$$S(b) + 1 \leq S(c) \leq S(b) - 2 + T$$

$$S(c) - T + 2 \leq S(b) \leq S(c) - 1$$

15-745: Software Pipelining

14

Carnegie Mellon
Todd C. Mowry

Strongly Connected Components

- **A strongly connected component (SCC)**
 - Set of nodes such that **every node can reach every other node**
- **Every node constrains all others from above and below**
 - Finds longest paths between every pair of nodes
 - As each node scheduled, find lower and upper bounds of all other nodes in SCC
- **SCCs are hard to schedule**
 - Critical cycle: no slack
 - Backtrack starting with the first node in SCC
 - increases T , increases slack
- **Edges between SCCs are acyclic**
 - Acyclic graph: every node is a separate SCC

15-745: Software Pipelining

15

Carnegie Mellon
Todd C. Mowry

Algorithm Design

- **Find lower bound of initiation interval: T_0**
 - based on resource constraints and precedence constraints
- **For $T = T_0, T_0+1, \dots$ until all nodes are scheduled**
 - E^* = longest path between each pair
 - For each SCC c in topological order
 - s_0 = Earliest c can be scheduled
 - For each $s = s_0, s_0+1, \dots, s_0+T-1$
 - if $\text{SCCScheduled}(c, s)$ break;
 - If c cannot be scheduled return false;
 - return true;

15-745: Software Pipelining

16

Carnegie Mellon
Todd C. Mowry

Scheduling a Strongly Connected Component (SCC)

- ***SCCScheduled(c, s)***
 - Schedule first node at *s*, return false if fails
 - For each remaining node *n* in *c*
 - s_l = lower bound on *n* based on E^*
 - s_u = upper bound on *n* based on E^*
 - For each *s* = s_l , s_l+1 , $\min(s_l+T-1, s_u)$
 - if **NodeScheduled(n, s)** break;
 - If *n* cannot be scheduled return false;
 - return true;

15-745: Software Pipelining

17

Carnegie Mellon
Todd C. Mowry

Modulo Variable Expansion

• Software-pipelined code

```

1. LD R5,0(R1++)
2. LD R6,0(R1++)
3. MUL R7,R5,R6
4. LD R6,0(R1++)
5. MUL R17,R5,R6
6. ADD R8,R7,R7
L:7. MUL R7,R5,R6
8. ST ADD LD LD BL L
9. MUL LD
10. ST ADD LD
11. MUL
12. ST ADD
13.
14. ST ADD

```

```

1. LD R5,0(R1++)
2. LD R6,0(R2++)
3. MUL R7,R5,R6
4.
5. ADD R8,R7,R4
6.
7. ST 0(R3++) ,R8

```

15-745: Software Pipelining

18

Carnegie Mellon
Todd C. Mowry

Modulo Variable Expansion

```

1. LD R5,0(R1++)
2. LD R6,0(R1++)
3. LD R5,0(R1++) MUL R7,R5,R6
4. LD R6,0(R1++)
5. LD R5,0(R1++) MUL R17,R5,R6
6. LD R6,0(R1++) ADD R8,R7,R7
L:7. LD R5,0(R1++) MUL R7,R5,R6
8. LD R6,0(R1++) ADD R8,R17,R17 ST 0(R3++) ,R8
9. LD R5,0(R1++) MUL R17,R5,R6
10. LD R6,0(R1++) ADD R8,R7,R7 ST 0(R3++) ,R8 BL L
11. MUL R7,R5,R6
12. ADD R8,R17,R17 ST 0(R3++) ,R8
13.
14. ADD R8,R7,R7 ST 0(R3++) ,R8
15.
16. ST 0(R3++) ,R8

```

15-745: Software Pipelining

19

Carnegie Mellon
Todd C. Mowry

Algorithm

- Normally, every iteration uses the same set of registers
 - introduces artificial anti-dependences for software pipelining
- Modulo variable expansion algorithm
 - schedule each iteration ignoring artificial constraints on registers
 - calculate life times of registers
 - degree of unrolling = $\max_r (\text{lifetime}_r / T)$
 - unroll the steady state of software pipelined loop to use different registers
- Code generation
 - generate one pipelined loop with only one exit (at beginning of steady state)
 - generate one unpipelined loop to handle the rest
 - code generation is the messiest part of the algorithm!

15-745: Software Pipelining

20

Carnegie Mellon
Todd C. Mowry

Conclusions

- **Numerical Code**
 - Software pipelining is useful for machines with a lot of pipelining and instruction level parallelism
 - Compact code
 - **Limits to parallelism:** dependences, critical resource
