CS 418, Spring 2008
Project Final Report
Due: Wednesday, April 30, noon

I am flexible regarding the format of the final report for your project. The one required element is that you include a breakdown of how you would like the credit to be distributed among the partners, based upon their contributions (e.g., 50%-50%, 60%-40%, etc.).

I would suggest that you pattern it after a research paper, and that you attempt to answer the follow questions somewhere in your report:

- What were the goals of your project? (i.e. what problem were your trying to solve, what is the motivation for this, etc.)

- Describe your experimental setup (e.g., machine used, input data sets, etc.) in sufficient detail that the reader could potentially recreate your experiments.

- What surprises did you encounter in your project?

- Please describe the iterative process by which you arrived at your final design. (i.e. don't just present the final design, but discuss what you learned along the way, and how this guided you toward your final design.)

- What you have learned from this project? (This should be summarized in a "conclusions" section at the end of your report.)

Please hand in a hardcopy version of your report, and also put an electronic version (preferably in html) on your project web page. It would also be great if you could post links to your software on your project web page.
