15-496/782:
Artificial Neural Networks

Spring 2004

- Instructor:
  David S. Touretzky
  Computer Science Department
  dst@cs.cmu.edu
  office: WeH 8128 x8-7561

- Teaching Assistant:
  Kornel Laskowski
  Language Technologies Institute
  kornel@cs.cmu.edu x8-2518
  office hours: Tue. 4:30-6:30 @ NSH 2602H

Course Info

Time: Mon/Wed 3:30 to 4:50

Place: MM (Margaret Morrison) A14

Credit: 12 units

Textbook: Introduction to the Theory of Neural Computation, by Hertz, Krogh, and Palmer.

Readings books:
On reserve in E&S Library, or
see Jenn Landefeld in Wean Hall 8124.

The magic photocopying code...

Grading

For 15-496:

Homeworks, midterm, and final exam each contribute 33% of your course grade.

For 15-782:

Homeworks, midterm, final exam, and project each contribute 25% of your course grade.

Cheating/Plagiarism

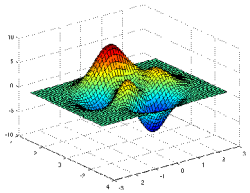
- If you have trouble understanding something, you can of course discuss the material with your classmates, as well as the TA and the instructor.

- But work you turn in with your name on it must have been done by you.

- If you use code or equations from someone else, and you disclose this, you may not get full credit, but you cannot be accused of cheating. Good advice throughout your career:
  always acknowledge your sources.

MATLAB

You need to learn MATLAB. It's fun!



Type "matlab" on Andrew to run it.
"peaks" will display this graph;
"help peaks" will tell you about it

Student Version of MATLAB: available for
Windows/Linux/Mac for $99.
Purchase from mathworks.com or CMU bookstore.

Tutorials are available online:
see the class homepage.

Varieties of "Neural Network" Research

1) Neuronal Modeling
2) Computational Neuroscience
3) Connectionist (PDP) Models
4) Artificial Neural Networks (ANNs)

Some investigators work in more than one area.

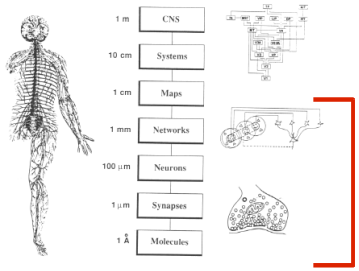
Courses in all four areas are available at CMU or Pitt.

1: Neuronal Modeling

Understand the operation of single neurons or small neural circuits.

Detailed biophysical models of nerve cells, and collections of cells.

J. Comp. Neuroscience;
CNS conference;
comp. neuro. course at Pitt (Bard Ermentrout, Math Dept.)



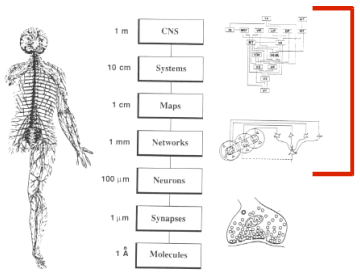
Churchland & Sejnowski 1988

2: Computational Neuroscience

Model information processing in actual brain systems.

The models refer to specific anatomical structures, but their operation may be abstract.

Network; J. Neurosci.;
Computation in Neural Systems conference;
15-883 (Touretzky)



Churchland & Sejnowski 1988

3: Connectionist (PDP) Modeling

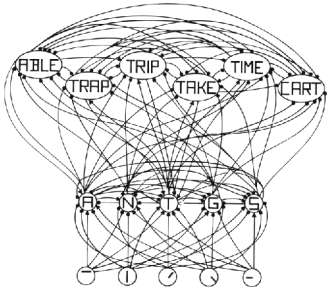
Model human cognition in a brain-like way:

Massively parallel constraint satisfaction.

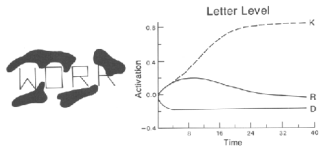
Distributed activity patterns instead of symbols.

Models are fairly abstract.

Cog Sci./Psych journals; PDP models course (Dave Plaut)



McClelland & Rumelhart 1981

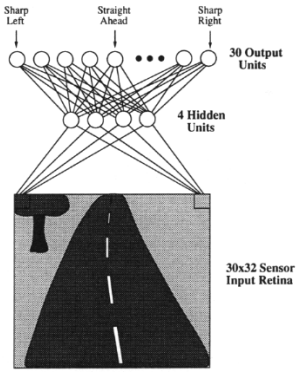


4: Artificial Neural Nets

Pattern recognition, adaptive control, time series prediction.
This is where the money gets made.

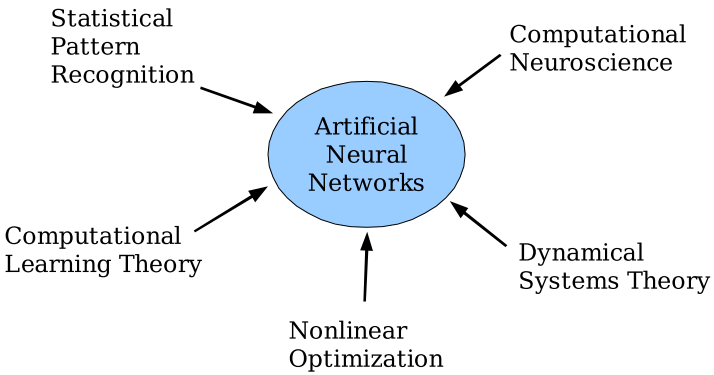
Simple, "neuron-like" computing elements; local computation.

NIPS conference, Neural Computation, 15-782 (this course).

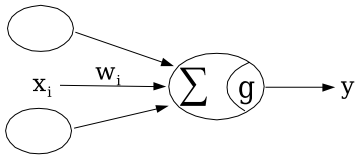


Pomerleau 1993: ALVINN

ANN Intellectual Landscape

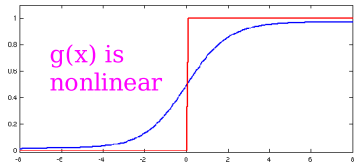


What's a "Neuron"?



$$\text{netact} = \sum_i w_i x_i = \vec{w} \cdot \vec{x}$$

$$y = g(\text{netact})$$



Organization of this Course

- Survey of neural net architectures: perceptrons, backprop nets, Kohonen, Hopfield, Boltzmann, etc.
- Sample applications: robot control, speech recognition, connectionist symbol processing.
- Hands-on experience: MATLAB demos and programming assignments.
- Biological basis of neural nets.
- Midterm and final exams. Project for 15-782.

13

What You Should Do Today

- Hand in your student survey questionnaire.
- Read chapter 1 of HK&P (Hertz, Krogh, & Palmer).
- Start learning MATLAB.
  - Type “demo” for a list of demos, and scroll down to the “Graphics” section. Play around a bit.
- Get started on Wednesday's reading.
