

Machine-Level Programming I: Basics

18-213/18-613: Introduction to Computer Systems 4th Lecture, January 26th, 2023

Today: Machine Programming I: Basics

- History of Intel processors and architectures
- Assembly Basics: Registers, operands, move
- **Arithmetic & logical operations**
- C, assembly, machine code

CSAPP 3.1

CSAPP 3.3-3.4

CSAPP 3.5

CSAPP 3.2

Intel x86 Processors

- Dominate laptop/desktop/server market
- Evolutionary design
 - Backwards compatible up until 8086, introduced in 1978
 - Added more features as time goes on
- x86 is a Complex Instruction Set Computer (CISC)
 - Many different instructions with many different formats
 - But, only small subset encountered with Linux programs
- Compare: Reduced Instruction Set Computer (RISC)
 - RISC: *very few* instructions, with *very few* modes for each
 - RISC can be quite fast (but Intel still wins on speed!)
 - Current RISC renaissance (e.g., ARM, RISCV), especially for low-power

Intel x86 Evolution: Milestones

Name Date Transistors MHz

■ 8086 1978 29K 5-10

First 16-bit Intel processor. Basis for IBM PC & DOS

1MB address space

■ 386 1985 275K 16-33

First 32 bit Intel processor, referred to as IA32

Added "flat addressing", capable of running Unix

■ Pentium 4E 2004 125M 2800-3800

First 64-bit Intel x86 processor, referred to as x86-64

■ Core 2 2006 291M 1060-3333

First multi-core Intel processor

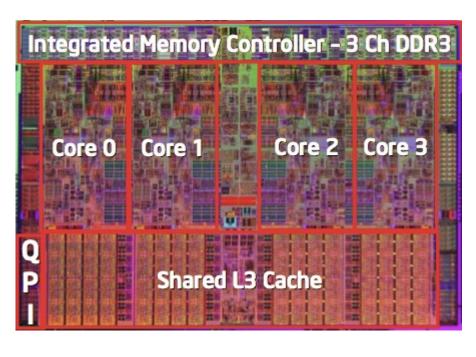

■ Core i7 2008 731M 1600-4400

Four cores (our shark machines)

Intel x86 Processors, cont.

Machine Evolution

386	1985	0.3M
Pentium	1993	3.1M
Pentium/MMX	1997	4.5M
PentiumPro	1995	6.5M
Pentium III	1999	8.2M
Pentium 4	2000	42M
Core 2 Duo	2006	291M
Core i7	2008	731M

Added Features

Core i7 Skylake

Instructions to support multimedia operations

2015

Instructions to enable more efficient conditional operations

1.9B

- Transition from 32 bits to 64 bits
- More cores

Intel x86 Processors, cont.

3.	Ivy Bridge	2012	22 nm	
4.	Haswell	2013	22 nm	
5.	Broadwell	2014	14 nm	
6.	Skylake	2015	14 nm	
7.	Kaby Lake	2016	14 nm	
8.	Coffee Lake	2017	14 nm	
9.	Cannon Lake	2018	10 nm	
10.	Ice Lake	2019	10 nm	
11.	Tiger Lake	2020	10 nm	
12.	Alder Lake	2021	10 nm	
13.	Raptor Lake	2022	10 nm "Intel 7 process"	"

2023-24?

Process technology dimension = width of narrowest wires (10 nm ≈ 100 atoms wide)

Meteor Lake.

Intel's Latest: Raptor Lake (2022)

In recent years, increasing die space devoted to the graphics/AI engine

x86 Clones: Advanced Micro Devices (AMD)

Historically

- AMD has followed just behind Intel
- A little bit slower, a lot cheaper

Then

- Recruited top circuit designers from Digital Equipment Corp. and other downward trending companies
- Built Opteron: tough competitor to Pentium 4
- Developed x86-64, their own extension to 64 bits

Recent Years

- Intel got its act together
 - 1995-2011: Lead semiconductor "fab" in world
 - 2018: #2 largest by \$\$ (#1 is Samsung)
 - 2019-2023: back-and-forth with Samsung for #1
- AMD fell behind
 - Relies on external semiconductor manufacturer GlobalFoundaries
 - ca. 2019 CPUs (e.g., Ryzen) are competitive again (with TSMC)

Intel's 64-Bit History

- 2001: Intel Attempts Radical Shift from IA32 to IA64
 - Totally different architecture (Itanium, AKA "Itanic")
 - Executes IA32 code only as legacy
 - Performance disappointing
- 2003: AMD Steps in with Evolutionary Solution
 - x86-64 (now called "AMD64")
- Intel Felt Obligated to Focus on IA64
 - Hard to admit mistake or that AMD is better
- 2004: Intel Announces EM64T extension to IA32
 - Extended Memory 64-bit Technology
 - Almost identical to x86-64!
- Virtually all modern x86 processors support x86-64
 - But, lots of code still runs in 32-bit mode

Our Coverage

IA32

- The traditional x86
- For 15/18-213: RIP, Summer 2015

■ x86-64

- The standard
- shark> gcc hello.c
- shark> gcc -m64 hello.c

Presentation

- Book covers x86-64
- Web aside on IA32
- We will only cover x86-64

Today: Machine Programming I: Basics

- History of Intel processors and architectures
- Assembly Basics: Registers, operands, move
- Arithmetic & logical operations
- C, assembly, machine code

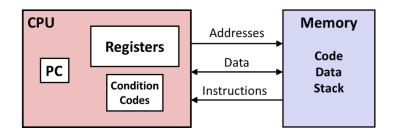

Levels of Abstraction

C programmer

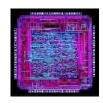

```
#include <stdio.h>
int main() {
  int i, n = 10, t1 = 0, t2 = 1, nxt;
  for (i = 1; i <= n; ++i) {
    printf("%d, ", t1);
    nxt = t1 + t2;
    t1 = t2;
    t2 = nxt; }
  return 0; }</pre>
```

Seems like nice clean layers...

Assembly programmer

Computer Designer

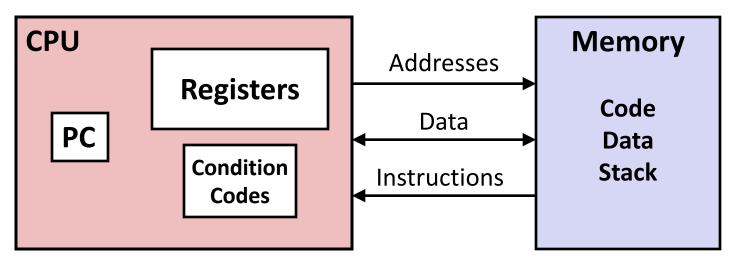

Gates, clocks, circuit layout, ...

Definitions

- Architecture: (also ISA: instruction set architecture) The parts of a processor design that one needs to understand for writing correct machine/assembly code
 - Examples: instruction set specification, registers
 - Machine Code: The byte-level programs that a processor executes
 - Assembly Code: A text representation of machine code
- Microarchitecture: Implementation of the architecture
 - Examples: cache sizes and core frequency
- Example ISAs:
 - Intel: x86, IA32, Itanium, x86-64
 - ARM: Used in almost all mobile phones
 - RISC V: Recent open-source ISA

Assembly/Machine Code View

Programmer-Visible State

- PC: Program counter
 - Address of next instruction
 - Called "RIP" (x86-64)
- Register file
 - Heavily used program data
- **Condition codes**
 - Store status information about most recent arithmetic or logical operation
 - Used for conditional branching

Memory

- Byte addressable array
- Code and user data
- Stack to support procedures

Bryant a

Assembly Characteristics: Data Types

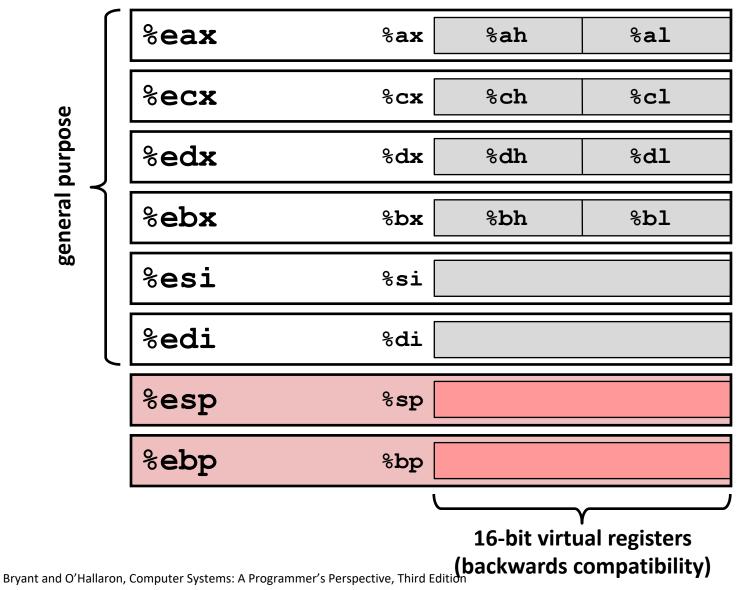

- "Integer" data of 1, 2, 4, or 8 bytes
 - Data values
 - Addresses (untyped pointers)
- Floating point data of 4, 8, or 10 bytes
- (SIMD vector data types of 8, 16, 32 or 64 bytes)
- Code: Byte sequences encoding series of instructions
- No aggregate types such as arrays or structures
 - Just contiguously allocated bytes in memory

x86-64 Integer Registers

%rax	%eax	% r8		%r8d
%rbx	%ebx	%r9		%r9d
%rcx	%ecx	% r1 (0	%r10d
%rdx	%edx	% r1 :	1	%r11d
%rsi	%esi	%r1	2	%r12d
%rdi	%edi	% r1 :	3	%r13d
%rsp	%esp	% r1	4	%r14d
%rbp	%ebp	%r1	5	%r15d

- Can reference low-order 4 bytes (also low-order 1 & 2 bytes)
- Not part of memory (or cache)

Some History: IA32 Registers

Origin (mostly obsolete)

accumulate

counter

data

base

source index

destination index

stack pointer base pointer

Assembly Characteristics: Operations

- Transfer data between memory and register
 - Load data from memory into register
 - Store register data into memory
- Perform arithmetic function on register or memory data
- Transfer control
 - Unconditional jumps to/from procedures
 - Conditional branches
 - Indirect branches

Moving Data

- Moving Data
 - movq Source, Dest
- Operand Types
 - Immediate: Constant integer data
 - Example: \$0x400, \$-533
 - Like C constant, but prefixed with \\$'
 - Encoded with 1, 2, or 4 bytes
 - Register: One of 16 integer registers
 - Example: %rax, %r13
 - But %rsp reserved for special use
 - Others have special uses for particular instructions
 - Memory 8 consecutive bytes of memory at address given by register
 - Simplest example: (%rax)
 - Various other "addressing modes"

%rax

%rcx

%rdx

%rbx

%rsi

%rdi

%rsp

%rbp

%rN

Warning: Intel docs use mov *Dest, Source*

movq Operand Combinations

Cannot do memory-memory transfer with a single instruction

Simple Memory Addressing Modes

- Normal (R) Mem[Reg[R]]
 - Register R specifies memory address
 - Aha! Pointer dereferencing in C

```
movq (%rcx),%rax
```

- Displacement D(R) Mem[Reg[R]+D]
 - Register R specifies start of memory region
 - Constant displacement D specifies offset

```
movq 8(%rbp),%rdx
```

Example of Simple Addressing Modes

```
void
whatAmI(<type> a, <type> b)
{
    ????
}

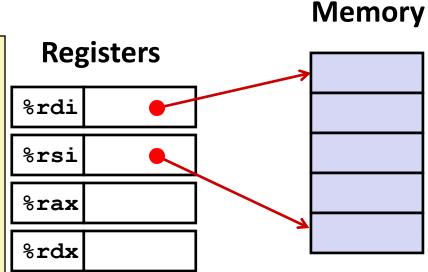

%rsi
%rdi
```

```
whatAmI:
  movq (%rdi), %rax
  movq (%rsi), %rdx
  movq %rdx, (%rdi)
  movq %rax, (%rsi)
  ret
```

Example of Simple Addressing Modes

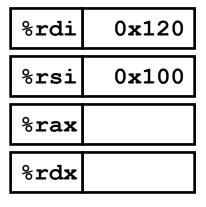

```
void swap
   (long *xp, long *yp)
{
   long t0 = *xp;
   long t1 = *yp;
   *xp = t1;
   *yp = t0;
}
```

void swap (long *xp, long *yp) { long t0 = *xp; long t1 = *yp; *xp = t1; *yp = t0; }

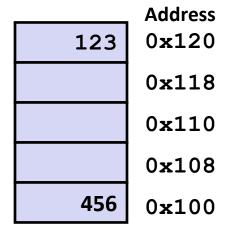

Register	Value
%rdi	хр
%rsi	ур
%rax	t0
%rdx	t1

Registers

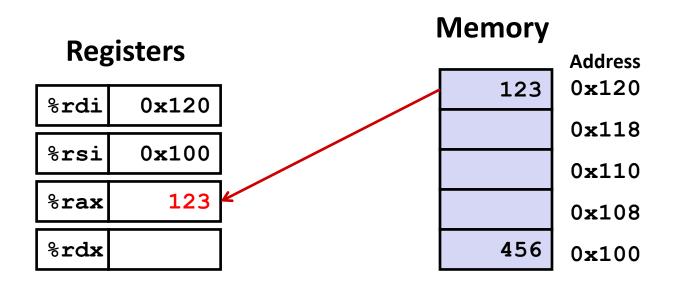

Memory

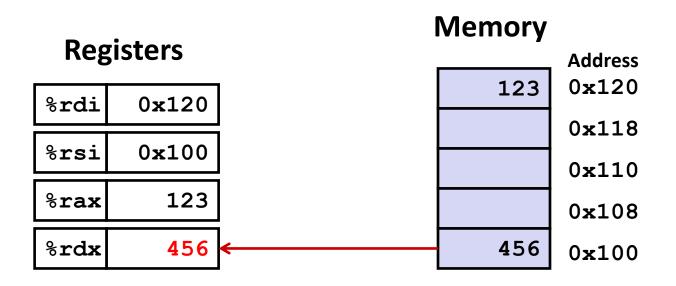

swap:

```
movq (%rdi), %rax # t0 = *xp
movq (%rsi), %rdx # t1 = *yp
movq %rdx, (%rdi) # *xp = t1
movq %rax, (%rsi) # *yp = t0
ret
```

swap:

```
movq (%rdi), %rax # t0 = *xp
movq (%rsi), %rdx # t1 = *yp
movq %rdx, (%rdi) # *xp = t1
movq %rax, (%rsi) # *yp = t0
ret
```

```
movq (%rdi), %rax # t0 = *xp

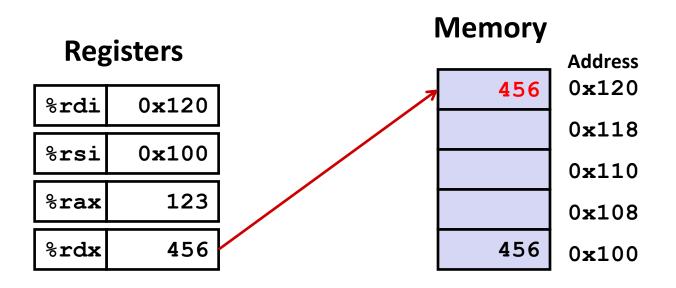

movq (%rsi), %rdx # t1 = *yp

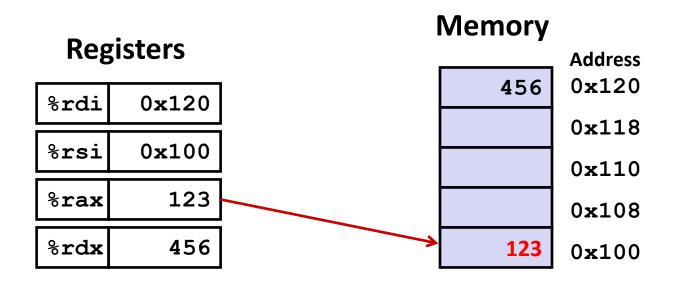

movq %rdx, (%rdi) # *xp = t1
```

movq %rax, (%rsi) # *yp = t0

ret

swap:

```
swap:
          (%rdi), %rax # t0 = *xp
  movq
       (%rsi), %rdx # t1 = *yp
  movq
       %rdx, (%rdi) # *xp = t1
  movq
          %rax, (%rsi) # *yp = t0
```

movq

ret

Simple Memory Addressing Modes

- Normal (R) Mem[Reg[R]]
 - Register R specifies memory address
 - Aha! Pointer dereferencing in C

```
movq (%rcx),%rax
```

- Displacement D(R) Mem[Reg[R]+D]
 - Register R specifies start of memory region
 - Constant displacement D specifies offset

```
movq 8(%rbp),%rdx
```

Complete Memory Addressing Modes

Most General Form

D(Rb,Ri,S) Mem[Reg[Rb]+S*Reg[Ri]+D]

D: Constant "displacement" 1, 2, or 4 bytes

Rb: Base register: Any of 16 integer registers

Ri: Index register: Any, except for %rsp

• S: Scale: 1, 2, 4, or 8 (*why these numbers?*)

Special Cases

(Rb,Ri) Mem[Reg[Rb]+Reg[Ri]]

D(Rb,Ri) Mem[Reg[Rb]+Reg[Ri]+D]

(Rb,Ri,S) Mem[Reg[Rb]+S*Reg[Ri]]

Address Computation Examples

%rdx	0xf000
%rcx	0x0100

D(Rb,Ri,S) Mem[Reg[Rb]+S*Reg[Ri]+D]

- D: Constant "displacement" 1, 2, or 4 bytes
- Rb: Base register: Any of 16 integer registers
- Ri: Index register: Any, except for %rsp
- S: Scale: 1, 2, 4, or 8 (why these numbers?)

Expression	Address Computation	Address
0x8(%rdx)		
(%rdx,%rcx)		
(%rdx,%rcx,4)		
0x80(,%rdx,2)		

Address Computation Examples

%rdx	0xf000
%rcx	0x0100

Expression	Address Computation	Address
0x8(%rdx)	0xf000 + 0x8	0xf008
(%rdx,%rcx)	0xf000 + 0x100	0xf100
(%rdx,%rcx,4)	0xf000 + 4*0x100	0xf400
0x80(,%rdx,2)	2*0xf000 + 0x80	0x1e080

Today: Machine Programming I: Basics

- History of Intel processors and architectures
- Assembly Basics: Registers, operands, move
- Arithmetic & logical operations
- C, assembly, machine code

Address Computation Instruction

leaq Src, Dst

- Src is address mode expression
- Set Dst to address denoted by expression

Uses

- Computing addresses without a memory reference
 - E.g., translation of p = &x[i];
- Computing arithmetic expressions of the form x + k*y
 - k = 1, 2, 4, or 8

Example

```
long m12(long x)
{
   return x*12;
}
```

Converted to ASM by compiler:

```
leaq (%rdi,%rdi,2), %rax # t = x+2*x
salq $2, %rax # return t<<2</pre>
```

Some Arithmetic Operations

Two Operand Instructions:

Format	Computation		
addq	Src,Dest	Dest = Dest + Src	
subq	Src,Dest	Dest = Dest – Src	
imulq	Src,Dest	Dest = Dest * Src	
shlq	Src,Dest	Dest = Dest << Src	Synonym: salq
sarq	Src,Dest	Dest = Dest >> Src	Arithmetic
shrq	Src,Dest	Dest = Dest >> Src	Logical
xorq	Src,Dest	Dest = Dest ^ Src	
andq	Src,Dest	Dest = Dest & Src	
orq	Src,Dest	Dest = Dest Src	

- Watch out for argument order! Src,Dest (Warning: Intel docs use "op Dest,Src")
- No distinction between signed and unsigned int (why?)

Quiz Time!

Some Arithmetic Operations

One Operand Instructions

```
incq Dest Dest = Dest + 1

decq Dest Dest = Dest - 1

negq Dest Dest = Dest

notq Dest Dest = \simDest
```

See book for more instructions

- Depending how you count, there are 2,034 total x86 instructions
- (If you count all addr modes, op widths, flags, it's actually 3,683)

Arithmetic Expression Example

```
long arith
(long x, long y, long z)
{
  long t1 = x+y;
  long t2 = z+t1;
  long t3 = x+4;
  long t4 = y * 48;
  long t5 = t3 + t4;
  long rval = t2 * t5;
  return rval;
}
```

```
arith:
  leaq (%rdi,%rsi), %rax
  addq %rdx, %rax
  leaq (%rsi,%rsi,2), %rdx
  salq $4, %rdx
  leaq 4(%rdi,%rdx), %rcx
  imulq %rcx, %rax
  ret
```

Interesting Instructions

- leaq: address computation
- **salq**: shift
- imulq: multiplication
 - Curious: only used once...

Understanding Arithmetic Expression Example

```
long arith
(long x, long y, long z)
  long t1 = x+y;
  long t2 = z+t1;
  long t3 = x+4;
  long t4 = y * 48;
  long t5 = t3 + t4;
  long rval = t2 * t5;
  return rval;
```

```
arith:
  leaq (%rdi,%rsi), %rax # t1
  addq %rdx, %rax # t2
  leaq (%rsi,%rsi,2), %rdx
  salq $4, %rdx # t4
  leaq 4(%rdi,%rdx), %rcx # t5
  imulq %rcx, %rax # rval
  ret
```

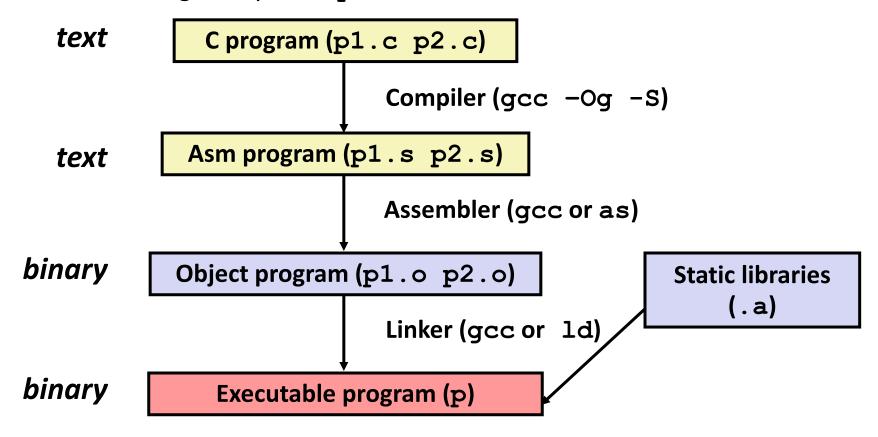

Register	Use(s)
%rdi	Argument x
%rsi	Argument y
%rdx	Argument z , t4
%rax	t1, t2, rval
%rcx	t5

Today: Machine Programming I: Basics

- History of Intel processors and architectures
- Assembly Basics: Registers, operands, move
- Arithmetic & logical operations
- C, assembly, machine code

Turning C into Object Code

- Code in files p1.c p2.c
- Compile with command: gcc -Og p1.c p2.c -o p
 - Use basic optimizations (-Og) [New to recent versions of GCC]
 - Put resulting binary in file p

Compiling Into Assembly

C Code (sum.c)

Generated x86-64 Assembly

```
sumstore:
   pushq %rbx
   movq %rdx, %rbx
   call plus
   movq %rax, (%rbx)
   popq %rbx
   ret
```

Obtain (on shark machine) with command

Produces file sum.s

Warning: Will get very different results on non-Shark machines (Andrew Linux, Mac OS-X, ...) due to different versions of gcc and different compiler settings.

What it really looks like

```
.globl sumstore
       .type sumstore, @function
sumstore:
.LFB35:
       .cfi startproc
       pushq %rbx
       .cfi def cfa offset 16
       .cfi offset 3, -16
       movq %rdx, %rbx
       call plus
       movq %rax, (%rbx)
       popq %rbx
       .cfi def cfa offset 8
       ret
       .cfi endproc
.LFE35:
       .size sumstore, .-sumstore
```

What it really looks like

```
.glob1 sumstore
.type sumstore, @function
```

Things that look weird and are preceded by a "are generally directives.

```
sumstore:
.LFB35:
       .cfi startproc
       pushq %rbx
       .cfi def cfa offset 16
       .cfi offset 3, -16
       movq %rdx, %rbx
       call plus
       movq %rax, (%rbx)
       popq %rbx
       .cfi def cfa offset 8
       ret
       .cfi endproc
.LFE35:
       .size sumstore, .-sumstore
```

```
sumstore:
  pushq %rbx
  movq %rdx, %rbx
  call plus
  movq %rax, (%rbx)
  popq %rbx
  ret
```

Assembly Characteristics: Data Types

- "Integer" data of 1, 2, 4, or 8 bytes
 - Data values
 - Addresses (untyped pointers)
- Floating point data of 4, 8, or 10 bytes
- (SIMD vector data types of 8, 16, 32 or 64 bytes)
- Code: Byte sequences encoding series of instructions
- No aggregate types such as arrays or structures
 - Just contiguously allocated bytes in memory

Assembly Characteristics: Operations

- Transfer data between memory and register
 - Load data from memory into register
 - Store register data into memory
- Perform arithmetic function on register or memory data
- Transfer control
 - Unconditional jumps to/from procedures
 - Conditional branches

0x5b

0xc3

Assembler

- Translates .s into .o
- Binary encoding of each instruction
- Nearly-complete image of executable code
- Missing linkages between code in different files

Linker

- Resolves references between files
- Combines with static run-time libraries
 - E.g., code for malloc, printf
- Some libraries are dynamically linked
 - Linking occurs when program begins execution

Total of 14 bytes

Each instruction

1, 3, or 5 bytes

Starts at address.

 0×0400595

Machine Instruction Example

0x40059e: 48 89 03

C Code

Store value t where designated by dest

Assembly

- Move 8-byte value to memory
 - Quad words in x86-64 parlance
- Operands:

t: Register %rax

dest: Register %rbx

*dest: Memory M[%rbx]

Object Code

- 3-byte instruction
- Stored at address 0x40059e

Disassembling Object Code

Disassembled

```
0000000000400595 <sumstore>:
 400595:
          53
                                   %rbx
                            push
 400596: 48 89 d3
                                   %rdx,%rbx
                           mov
 400599: e8 f2 ff ff ff
                           callq 400590 <plus>
 40059e: 48 89 03
                                   %rax, (%rbx)
                           mov
 4005a1:
          5b
                                   %rbx
                            pop
 4005a2: c3
                            reta
```

Disassembler

```
objdump -d sum
```

- Useful tool for examining object code
- Analyzes bit pattern of series of instructions
- Produces approximate rendition of assembly code
- Can be run on either a .out (complete executable) or .o file

Alternate Disassembly

Disassembled

- Disassembler examines bytes and reconstructs assembly source

Machine Programming I: Summary

History of Intel processors and architectures

Evolutionary design leads to many quirks and artifacts

C, assembly, machine code

- New forms of visible state: program counter, registers, ...
- Compiler must transform statements, expressions, procedures into low-level instruction sequences

Assembly Basics: Registers, operands, move

 The x86-64 move instructions cover wide range of data movement forms

Arithmetic

 C compiler will figure out different instruction combinations to carry out computation
