AI: Representation and Problem Solving

Solving Linear Programs & Integer Programming

Instructors: Tuomas Sandholm & Vince Conitzer

Slide credits: CMU AI with drawings from <http://ai.berkeley.edu>

Plan

Last Time

- Linear programming formulation
 - Problem description
 - Graphical representation
 - Optimization representation

Today

- Solving linear programs
- Higher dimensions than just 2
- Integer programs

Reminder: Cost Contours

Given the cost vector $[c_1, c_2]^T$ where will

$$\mathbf{c}^T \mathbf{x} = 0 ?$$

$$\mathbf{c}^T \mathbf{x} = 1 ?$$

$$\mathbf{c}^T \mathbf{x} = 2 ?$$

Solving a Linear Program

What is the solution to this LP?

<https://www.desmos.com/calculator/tnlo7p5plp>

Solving a Linear Program

Inequality form, with no constraints

$$\min_{\mathbf{x}} \quad \mathbf{c}^T \mathbf{x}$$

Solving a Linear Program

Inequality form, with one constraint

$$\begin{array}{ll} \min. & \mathbf{c}^\top \mathbf{x} \\ \text{s.t.} & a_1 x_1 + a_2 x_2 \leq b \end{array}$$

Poll 1

True or False: A minimizing LP with exactly one constraint, will always have a minimum objective at $-\infty$

$$\begin{array}{ll} \min_{\mathbf{x}} & \mathbf{c}^T \mathbf{x} \\ \text{s.t.} & a_1 x_1 + a_2 x_2 \leq b \end{array}$$

Solving an LP

An optimal solution exists at a feasible intersection of constraint boundaries!

Algorithms

- Check objective at all feasible intersections

In more detail:

1. Enumerate all intersections
2. Keep only those that are feasible (satisfy *all* inequalities)
3. Return feasible intersection with the lowest objective value

Solving an LP

But, how do we find the intersection between boundaries?

$$\begin{array}{ll} \min & \mathbf{c}^T \mathbf{x} \\ \text{s.t.} & \mathbf{A}\mathbf{x} \leq \mathbf{b} \end{array}$$

$$\mathbf{A} = \begin{bmatrix} -100 & -50 \\ 100 & 50 \\ 3 & 4 \\ -20 & -70 \end{bmatrix}$$

$$\mathbf{b} = \begin{bmatrix} -2000 \\ 2500 \\ 100 \\ -700 \end{bmatrix}$$

Solving an LP

An optimal solution exists at a feasible intersection of constraint boundaries!

Algorithms

- Check objective at all feasible intersections
- Simplex

Solving an LP

Simplex algorithm

- Start at a feasible intersection (if not trivial, can solve another LP to find one)
- Define successors as “neighbors” of current intersection
 - i.e., remove one row from our square subset of A , and add another row not in the subset; then check feasibility
- Move to any successor with lower objective than current intersection
 - If no such successors, we are done

Greedy local hill-climbing search! ... but always finds *optimal* solution

Solving an LP

An optimal solution exists at a feasible intersection of constraint boundaries!

Algorithms

- Check objective at all feasible intersections
- Simplex
- Interior Point

What about higher dimensions?

Problem
Description

Optimization
Representation

$$\begin{array}{ll} \min_{\mathbf{x}} & \mathbf{c}'\mathbf{x} \\ \text{s.t.} & A\mathbf{x} \leq \mathbf{b} \end{array}$$

Graphical Representation

“Marty, you’re not thinking fourth-dimensionally”

<https://www.youtube.com/watch?v=CUcNM7OsdY>

Shapes in higher dimensions

How do these linear shapes extend to 3-D, N-D?

$$a_1 x_1 + a_2 x_2 = b_1$$

$$a_1 x_1 + a_2 x_2 \leq b_1$$

$$a_{1,1} x_1 + a_{1,2} x_2 \leq b_1$$

$$a_{2,1} x_1 + a_{2,2} x_2 \leq b_2$$

$$a_{3,1} x_1 + a_{3,2} x_2 \leq b_3$$

$$a_{4,1} x_1 + a_{4,2} x_2 \leq b_4$$

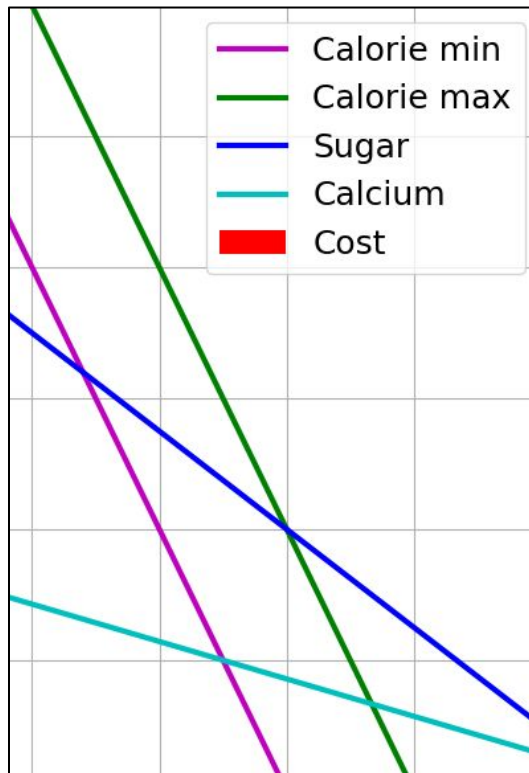

What are intersections in higher dimensions?

How do these linear shapes extend to 3-D, N-D?

$$\begin{array}{ll} \min & \mathbf{c}^T \mathbf{x} \\ \text{s.t.} & A\mathbf{x} \leq \mathbf{b} \end{array}$$

$$A = \begin{bmatrix} -100 & -50 \\ 100 & 50 \\ 3 & 4 \\ -20 & -70 \end{bmatrix} \quad \mathbf{b} = \begin{bmatrix} -2000 \\ 2500 \\ 100 \\ -700 \end{bmatrix}$$

Calorie min
Calorie max

Calcium

How do we find intersections in higher dimensions?

Still looking at subsets of A matrix

$$\begin{array}{ll} \min & \mathbf{c}^T \mathbf{x} \\ \text{s.t.} & A\mathbf{x} \leq \mathbf{b} \end{array}$$

$$A = \begin{bmatrix} -100 & -50 \\ 100 & 50 \\ 3 & 4 \\ -20 & -70 \end{bmatrix}$$

$$\mathbf{b} = \begin{bmatrix} -2000 \\ 2500 \\ 100 \\ -700 \end{bmatrix}$$

Calorie min
Calorie max
Sugar
Calcium

Complexity of linear programming

- Exponentially many intersections of constraints, so enumerating all of them is very slow
- There are known cases where the simplex algorithm takes exponential time, but it typically runs fast in polynomial time in practice
- Interior point methods run in worst-case polynomial time!

Integer programming

Linear Programming

We are trying healthy by finding the optimal amount of food to purchase.

We can choose the amount of **stir-fry** (ounce) and **boba** (fluid ounces).

Healthy Squad Goals

- $2000 \leq \text{Calories} \leq 2500$
- $\text{Sugar} \leq 100 \text{ g}$
- $\text{Calcium} \geq 700 \text{ mg}$

Food	Cost	Calories	Sugar	Calcium
Stir-fry (per oz)	1	100	3	20
Boba (per fl oz)	0.5	50	4	70

What is the cheapest way to stay “healthy” with this menu?

How much **stir-fry** (ounce) and **boba** (fluid ounces) should we buy?

Linear Programming □ Integer Programming

We are trying healthy by finding the optimal amount of food to purchase.

We can choose the amount of stir-fry (bowls) and boba (glasses).

Healthy Squad Goals

- $2000 \leq \text{Calories} \leq 2500$
- $\text{Sugar} \leq 100 \text{ g}$
- $\text{Calcium} \geq 700 \text{ mg}$

Food	Cost	Calories	Sugar	Calcium
Stir-fry (per bowl)	1	100	3	20
Boba (per glass)	0.5	50	4	70

What is the cheapest way to stay “healthy” with this menu?

How much stir-fry (ounce) and boba (fluid ounces) should we buy?

Linear Programming vs Integer Programming

Linear objective with linear constraints, but now with additional constraint that all values in \mathbf{x} must be integers

$$\begin{array}{ll} \min. & \mathbf{c}^T \mathbf{x} \\ \text{s.t.} & A\mathbf{x} \leq \mathbf{b} \end{array}$$

$$\begin{array}{ll} \min. & \mathbf{c}^T \mathbf{x} \\ \text{s.t.} & A\mathbf{x} \leq \mathbf{b} \\ & \mathbf{x} \in \mathbb{Z}^N \end{array}$$

We could also do:

- Even more constrained: Binary Integer Programming
- A hybrid: Mixed Integer Linear Programming

Notation Alert!

Integer Programming: Graphical Representation

Just add a grid of integer points onto our LP representation

$$\begin{array}{ll} \min. & \mathbf{c}^T \mathbf{x} \\ \mathbf{x} & \\ \text{s.t.} & A\mathbf{x} \leq \mathbf{b} \\ & \mathbf{x} \in \mathbb{Z}^N \end{array}$$

Relaxation

Relax IP to LP by dropping integer constraints

$$\begin{array}{ll} \min_{\mathbf{x}} & \mathbf{c}^T \mathbf{x} \\ \text{s.t.} & A\mathbf{x} \leq \mathbf{b} \\ & \mathbf{x} \in \mathbb{Z}^N \end{array}$$

Remember heuristics?

Poll 2 (use Piazza):

Let y_{IP}^* be the optimal objective of an integer program P .

Let \mathbf{x}_{IP}^* be an optimal point of an integer program P .

Let y_{LP}^* be the optimal objective of the LP-relaxed version of P .

Let \mathbf{x}_{LP}^* be an optimal point of the LP-relaxed version of P .

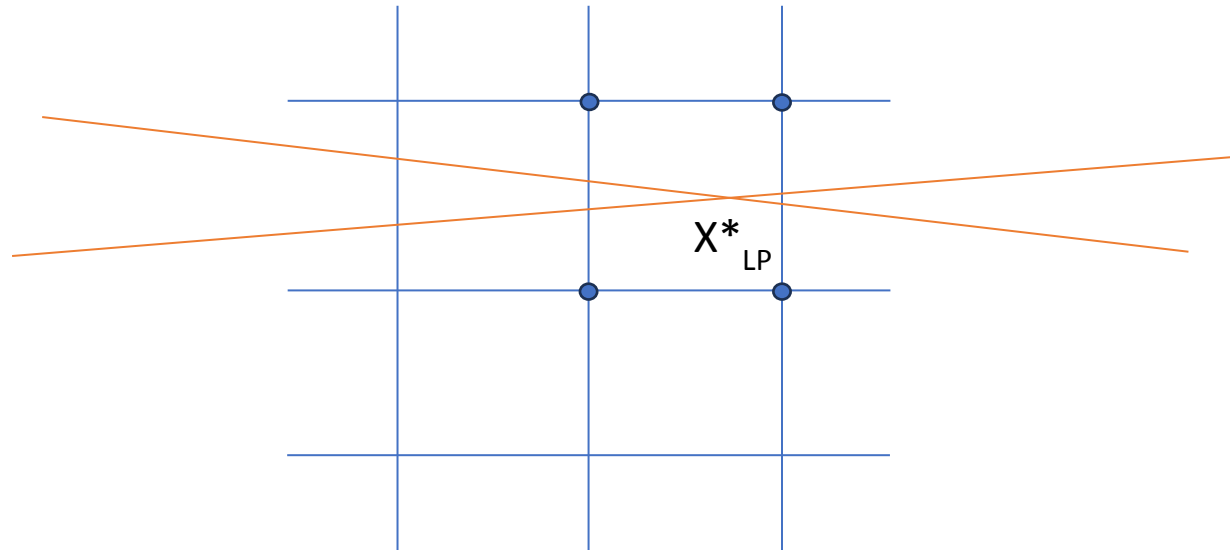

$$\begin{aligned} y_{IP}^* &= \min_{\mathbf{x}} && \mathbf{c}^T \mathbf{x} \\ &\text{s.t.} && A\mathbf{x} \leq \mathbf{b} \\ &&& \mathbf{x} \in \mathbb{Z}^N \end{aligned}$$

$$\begin{aligned} y_{LP}^* &= \min_{\mathbf{x}} && \mathbf{c}^T \mathbf{x} \\ &\text{s.t.} && A\mathbf{x} \leq \mathbf{b} \end{aligned}$$

Poll 3:

True/False: It is sufficient to consider the integer points around the corresponding LP solution?

Solving an IP

Branch and Bound algorithm

1. Push LP solution of problem into priority queue,
ordered by objective value of LP solution
2. Repeat:
 - If queue is empty, return IP is infeasible
 - Pop candidate solution \mathbf{x}_{LP}^* from priority queue ()
 - If \mathbf{x}_{LP}^* is all integer valued, we are done; return solution
 - Otherwise, select a coordinate x_i that is not integer valued, and add two additional LPs to the priority queue:

Left branch: Added constraint $x_i \leq \text{floor}(x_i)$

Branch and Bound Example

Priority Queue:

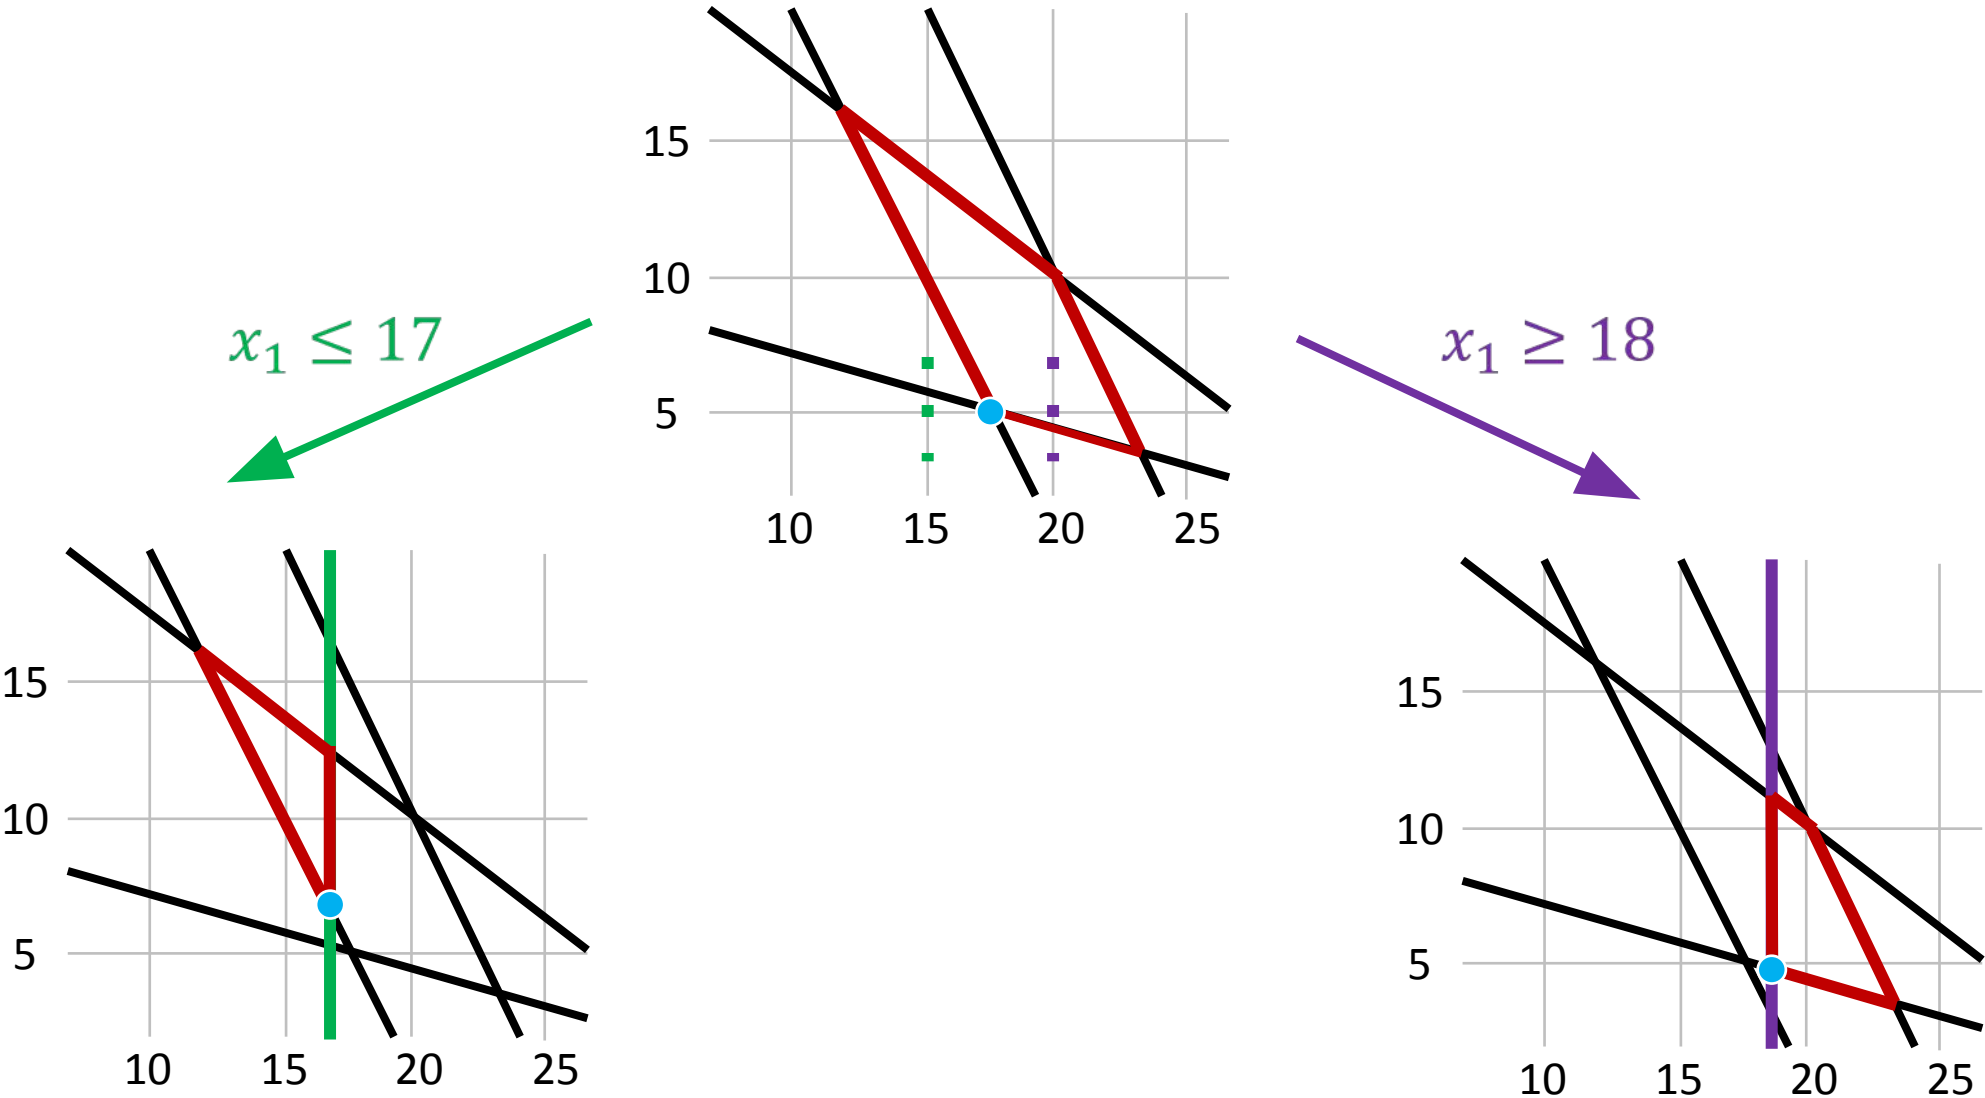

1. $\mathbf{x}^* = (17.5, 5), y^* = 20.5$

Branch and Bound Example

Branch and Bound Example

Branch and Bound Example

Priority Queue:

1. $\mathbf{x}^* = (17, 6)$, $y^* = 20.6$
2. $\mathbf{x}^* = (18, 4.85)$, $y^* = 20.91$
