<u>Unit 1 - Programming Skills and Computer Organization</u>

Unit 2 - Data Structures and Efficiency

Unit 3 - Scaling Up Computing

Unit 4 - CS as a Tool

Unit 5 - CS in the World

## Unit 1 - Programming Skills and Computer Organization

- Define the essential components of computer science, algorithms and abstraction
- Construct plain-language algorithms to solve basic tasks
- Recognize and use the basic data types in programs
- Interpret and react to basic **error messages** caused by programs
- Use variables in code and trace the different values they hold
- Understand how different **number systems** can represent the same information
- Translate binary numbers to decimal, and vice versa
- Interpret binary numbers as abstracted types, including colors and text
- Use **function calls** to run pre-built algorithms on specific inputs
- Identify the argument(s) and returned value of a function call
- Use libraries to import functions in categories like math, randomness, and graphics
- Use **function definitions** when reading and writing algorithms to implement procedures that can be repeated on different inputs
- Recognize the difference between local and global scope
- Trace function calls to understand how Python keeps track of nested function calls
- Use logical operators on Booleans to compute whether an expression is True or False
- Use conditionals when reading and writing algorithms that make choices based on data
- Recognize the different types of errors that can be raised when you run Python code

- Translate Boolean expressions to truth tables and circuits
- Translate circuits to truth tables and Boolean expressions
- Recognize how addition is done at the circuit level using algorithms and abstraction
- Use while loops when reading and writing algorithms to repeat actions while a certain condition is met
- Identify start values, continuing conditions, and update actions for loop control variables
- Use for loops when reading and writing algorithms to repeat actions a specified number of times
- Recognize which numbers will be produced by a **range** expression
- Index and slice into strings to break them up into parts
- Use for loops to loop over strings by index
- Translate algorithms from **control flow charts** to Python code
- Use **nesting** of statements to create complex control flow

# Unit 2 - Data Structures and Efficiency

- Read and write code using 1D and 2D lists
- Use string/list **methods** to call functions directly on values
- Recognize whether two values have the same reference in memory
- Recognize the difference between destructive vs. non-destructive functions/operations on mutable data types
- Use aliasing to write functions that destructively change lists
- Define and recognize base cases and recursive cases in recursive code
- Read and write basic recursive code
- Trace over recursive functions that use multiple recursive calls with Towers of Hanoi
- Recognize linear search on lists and in recursive contexts
- Use binary search when reading and writing code to search for items in sorted lists
- Identify the **keys** and **values** in a dictionary
- Use dictionaries when writing and reading code that uses pairs of data
- Use **for loops** to iterate over the parts of an **iterable** value
- Identify the worst case and best case inputs of functions
- Compare the **function families** that characterize different functions
- Calculate a specific function or algorithm's efficiency using **Big-O notation**
- Identify core parts of trees, including nodes, children, the root, and leaves
- Use binary trees implemented with dictionaries when reading and writing code
- Identify core parts of graphs, including nodes, edges, neighbors, weights, and directions.
- Use graphs implemented as dictionaries when reading and writing simple algorithms in code
- Identify whether a tree is a tree, a binary tree, or a binary search tree (BST)
- Search for values in trees using linear search and in BSTs using binary search
- Analyze the **efficiency** of binary search on **balanced** vs. **unbalanced** BSTs
- Recognize the requirements for building a good hash function and a good hashtable that lead to constant-time search

- Identify brute force approaches to common problems that run in O(n!) or O(2<sup>n</sup>), including solutions to Travelling Salesperson, puzzle-solving, subset sum,
  Boolean satisfiability, and exam scheduling
- Define the complexity classes P and NP and explain why these classes are important
- Identify whether an algorithm is **tractable** or **intractable**, and whether it is in **P**, **NP**, or **neither** complexity class
- Use **heuristics** to find good-enough solutions to NP problems in polynomial time

# Unit 3 - Scaling Up Computing

- Recognize and define the following keywords: concurrency, parallel programming, CPU, scheduler, throughput, multitasking, multiprocessing, and deadlock
- Calculate the **total steps** and **time steps** taken by a parallel algorithm
- Create pipelines to increase the efficiency of repeated operations by splitting steps across cores
- Recognize and define the following keywords: distributed computing, cloud computing, browsers, routers, ISPs, IP addresses, DNS servers, protocols, and packets.
- Use the MapReduce pattern to design parallelized algorithms for distributed computing
- Understand at a high level the **internet communication process** that happens when you click on a link to a website in your browser.
- Recognize and define the following keywords: fault tolerance, bottlenecks, net neutrality, data privacy, data security, DDOS attacks, and man-in-the-middle attacks
- Recognize and define common approaches of authentication, including passwords and certificates
- Recognize and define the core elements of encryption, including plaintext,
  ciphertext, keys, encoding, decoding, and breaking
- Trace common **encryption** algorithms, such as the **Caesar Cipher** and **RSA**, and recognize whether they are **symmetric** or **asymmetric**
- Read and write data from files
- Implement and use helper functions in code to break up large problems into solvable subtasks
- Install external modules and import them into files
- Learn how to use new libraries by using documentation and tutorials

### Unit 4 - CS as a Tool

- Identify whether features in a dataset are categorical, ordinal, or numerical
- Interpret data according to different protocols: CSV and JSON
- Use string operations and methods to extract data from plaintext
- Reformat data to find, add, remove, or reinterpret pre-existing data
- Represent the state of a system in a model by identifying components and rules
- Visualize a model using graphics
- Update a model over time based on rules
- Identify the three major categories of learning (supervised, unsupervised, and reinforcement) and the three major categories of reasoning (classification, regression, and clustering)
- Decide which combination of learning and reasoning categories are best used to solve a stated problem
- Perform basic analyses on data, including calculating statistics and probabilities, to answer simple questions
- Choose an appropriate visualization to create based on the number of dimensions and data types
- Create simple **matplotlib visualizations** that show the state of a dataset
- Update a model after events (mouse-based and keyboard-based) based on rules
- Use **Monte Carlo methods** to estimate the answer to a question
- Describe how training, validation, and testing are used to build a model and measure its performance
- Recognize how Als attempt to achieve goals by using a perception, reason, and action cycle
- Build **game trees** to represent the possible moves of a game
- Use the minimax algorithm to determine an Al's best next move in a game

### Unit 5 - CS in the World

- Big Ideas of: Introduction of the **theoretical concept** of a computer
- Big Ideas of: Construction of the first computer hardware and software
- Big Ideas of: Transition of computers from government/corporate to personal
- Big Ideas of: Connection of computers via the internet
- Understand the current extent of **data collection** on the internet and how data is used
- Understand the notice-and-choice model and its common criticisms
- Identify the societal impact when **automated decision-making** replaces human decision-making, including the effects of **bias**, **algorithmic appreciation**, **accountability**, and **explainability**
- Recognize and describe the key impacts of future computing ideas, potentially including: TBD.
