

Arrays

Memory Model

C0 Memory Model

- Variables live in **local memory**
 - The variables of a function are grouped in a **frame**

Here →

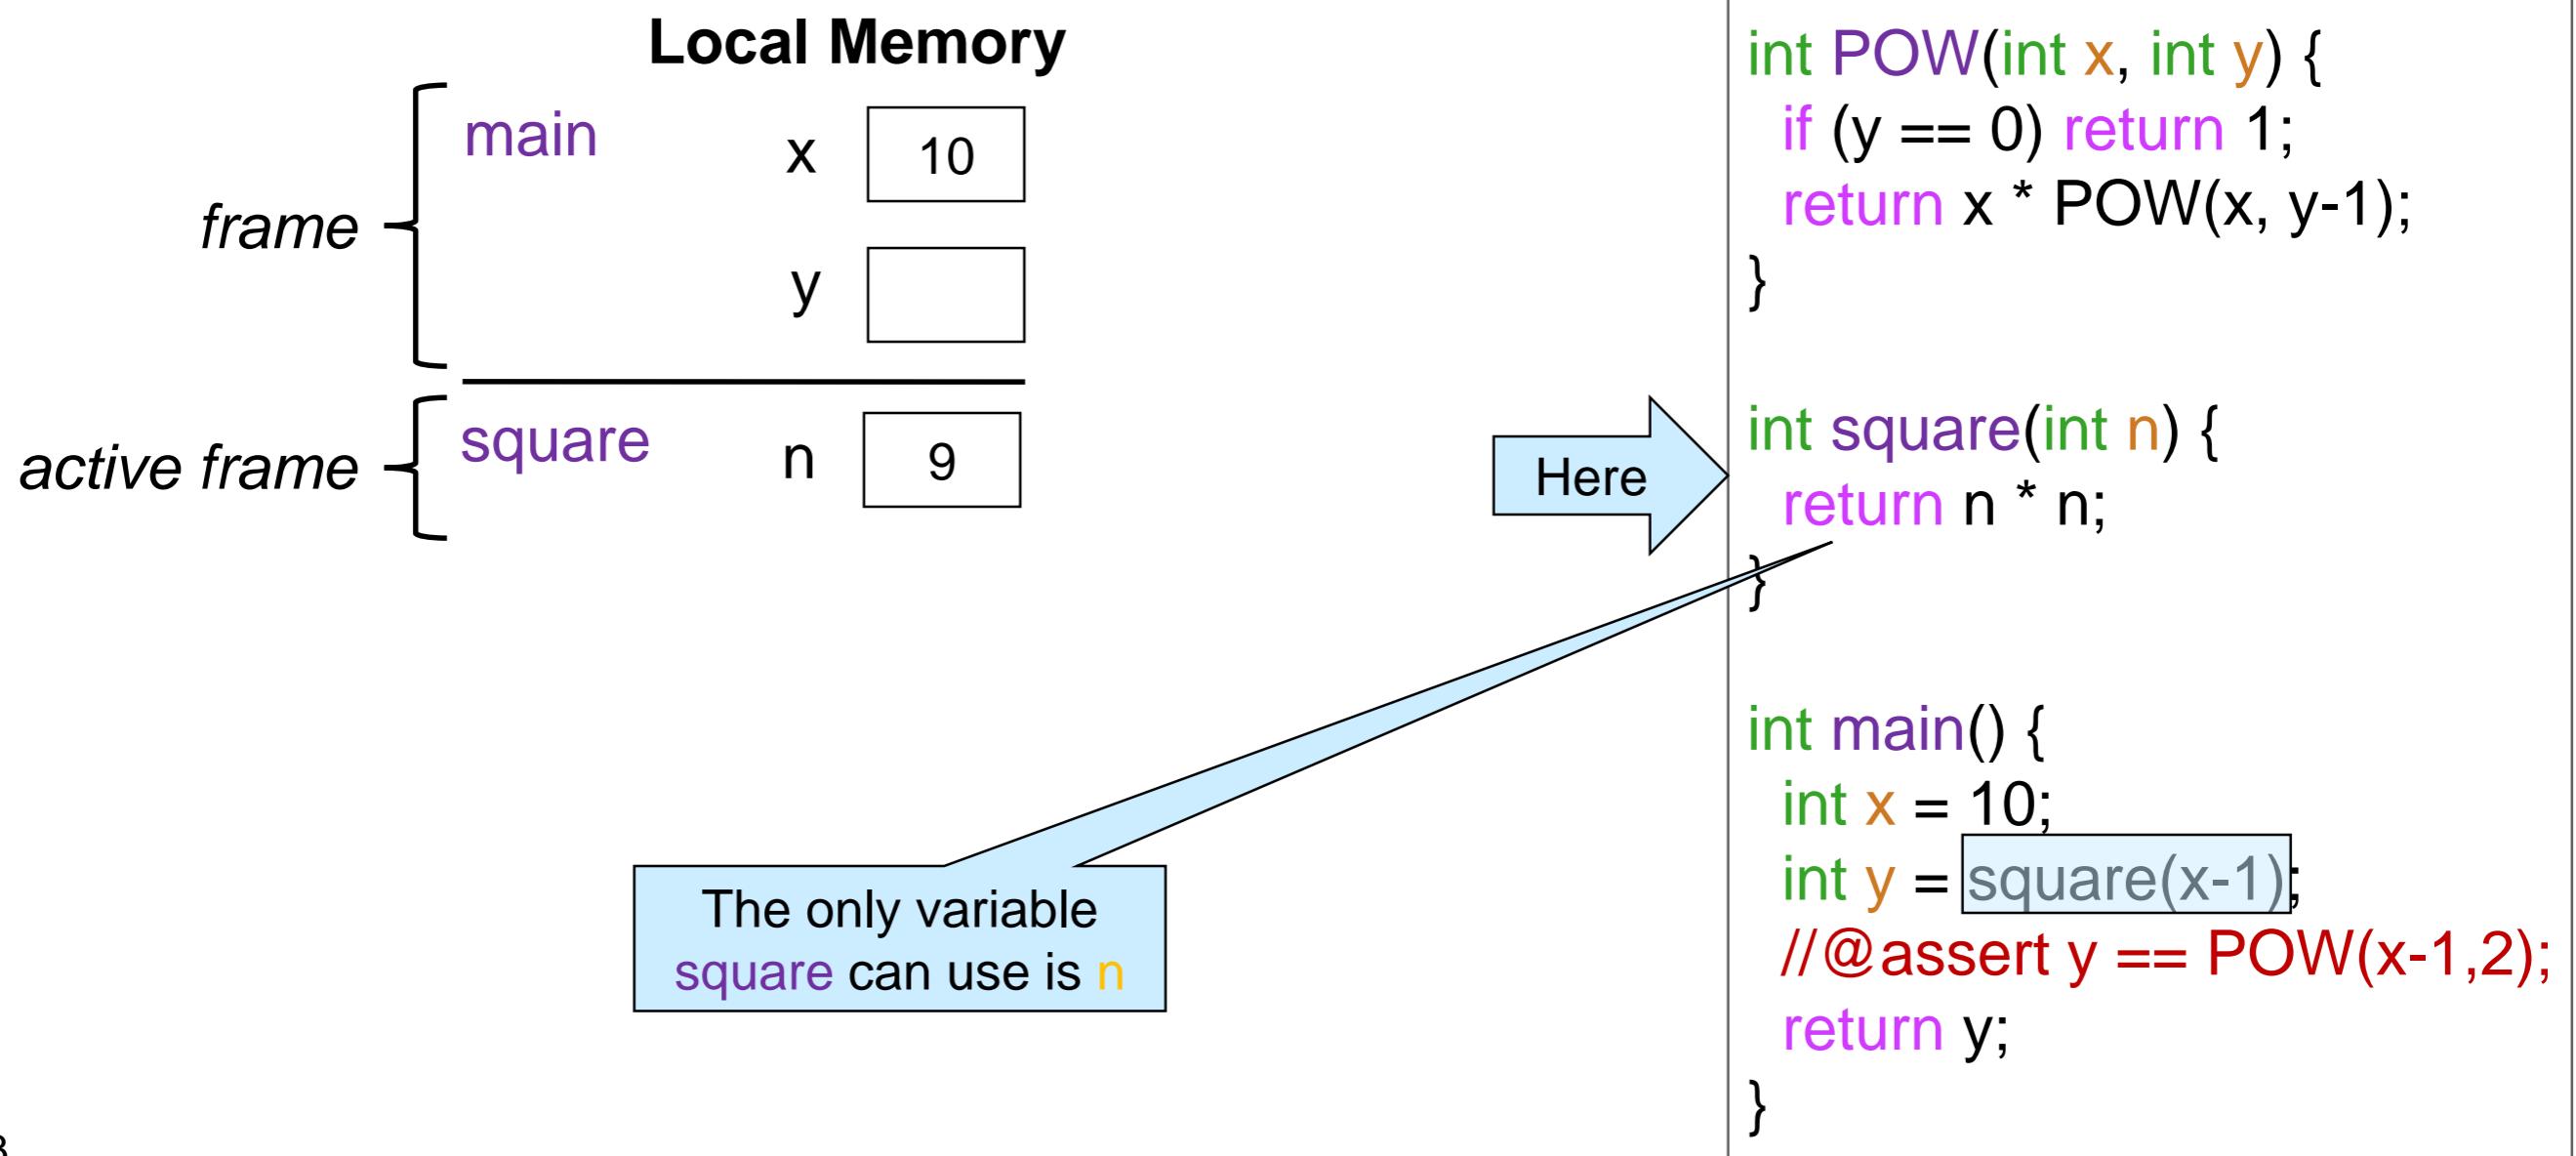

```
int POW(int x, int y) {
    if (y == 0) return 1;
    return x * POW(x, y-1);
}

int square(int n) {
    return n * n;
}

int main() {
    int x = 10;
    int y = square(x - 1);
    //@assert y == POW(x-1,2);
    return y;
}
```

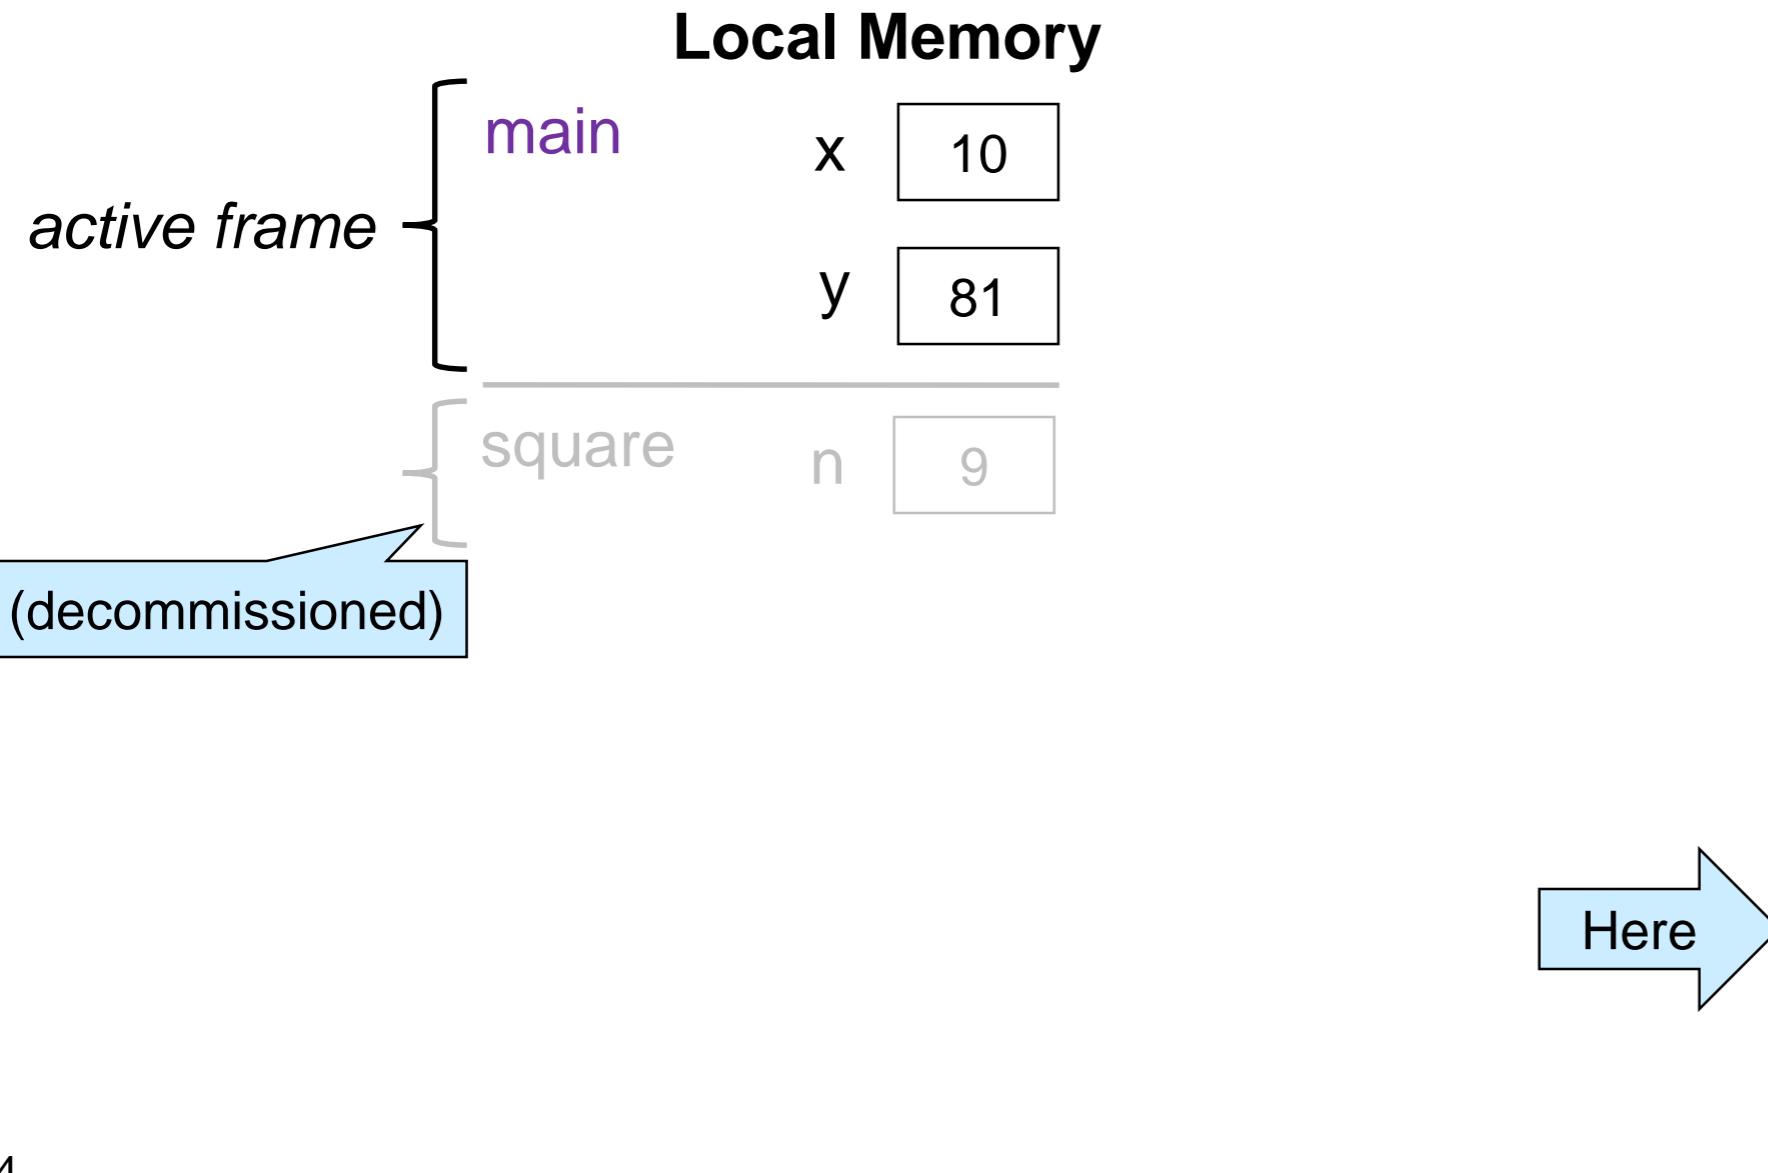

C0 Memory Model

- Each function currently being called has its own frame
 - A function can only manipulate the variables in its frame

C0 Memory Model

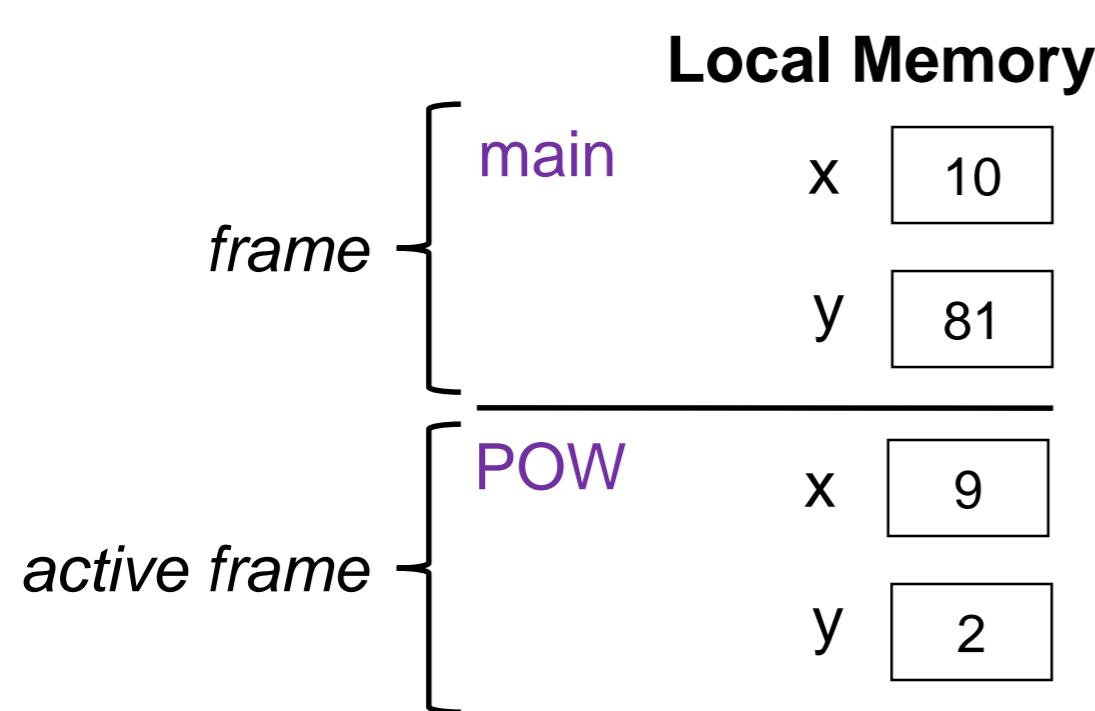

- The frame is decommissioned when the function returns

```
int POW(int x, int y) {  
    if (y == 0) return 1;  
    return x * POW(x, y-1);  
}  
  
int square(int n) {  
    return n * n;  
}  
  
int main() {  
    int x = 10;  
    int y = square(x - 1);  
    //@assert y == POW(x-1,2);  
    return y;  
}
```

C0 Memory Model

- The next function call adds a new frame
 - The variable names may be same as the caller
 - but the function can only manipulate the variables in **its** frame

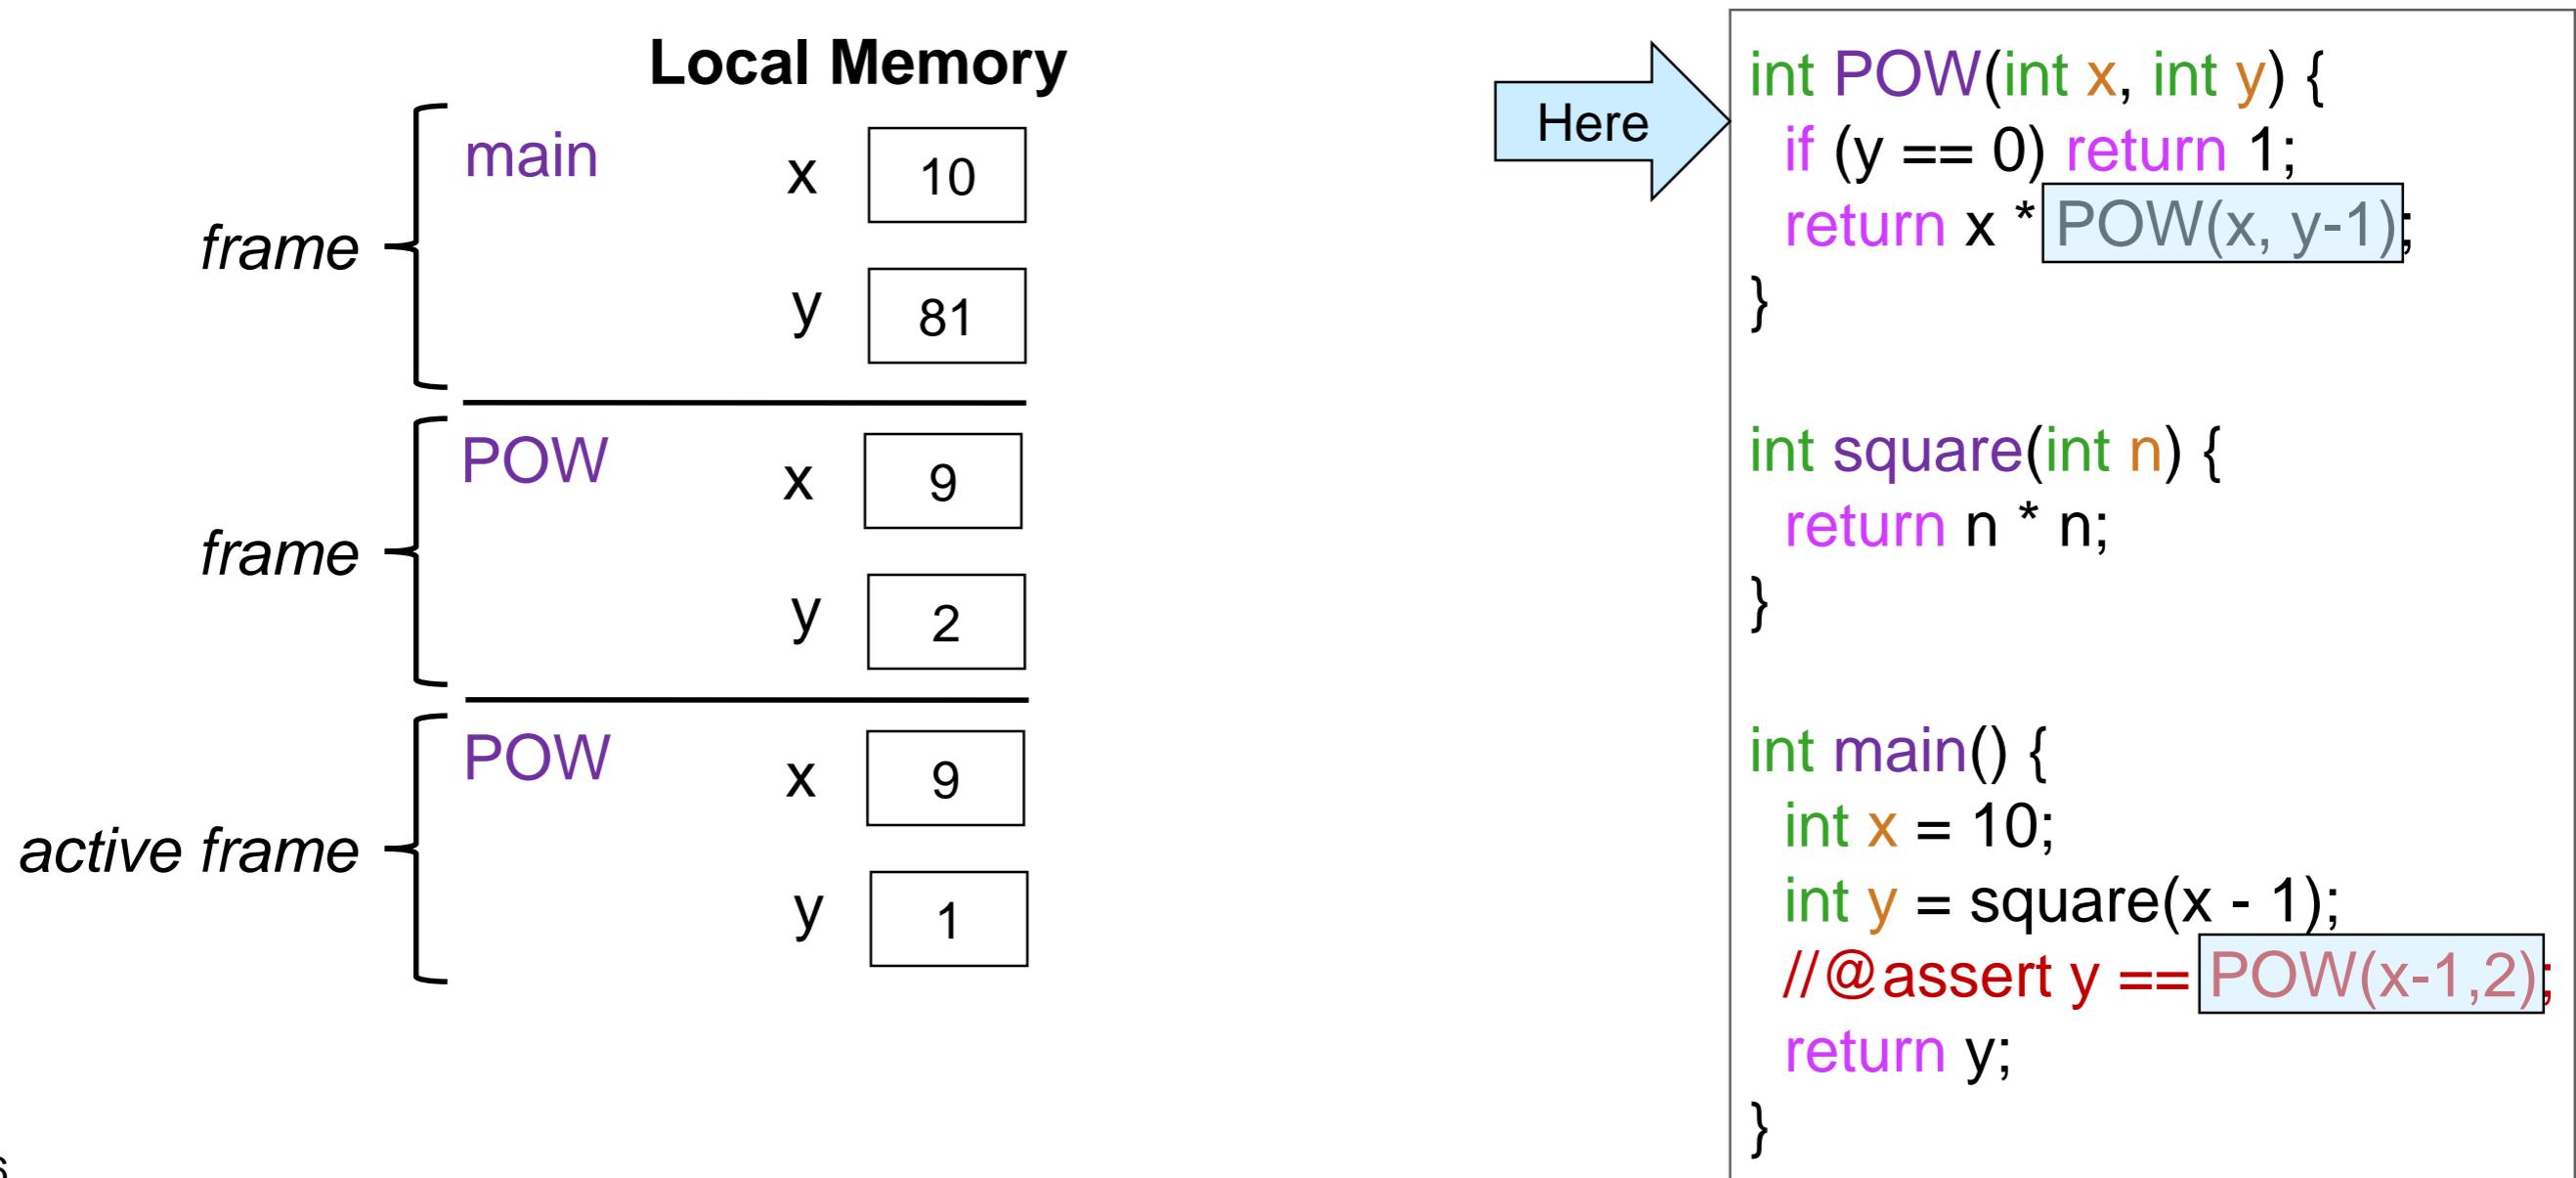

Here →

```
int POW(int x, int y) {  
    if (y == 0) return 1;  
    return x * POW(x, y-1);  
}  
  
int square(int n) {  
    return n * n;  
}  
  
int main() {  
    int x = 10;  
    int y = square(x - 1);  
    //@assert y == POW(x-1,2);  
    return y;  
}
```

C0 Memory Model

- The next function call adds a new frame
 - Recursive calls are treated the same way

Arrays

Arrays

- Types so far
 - `int`, `bool`, `char`, `string`
- Arrays are collections of data of the same type
 - `int[]` is the type of arrays whose elements have type `int`
 - `string[]` is the type of arrays whose elements have type `string`
 - We can have arrays with elements of *any* type
 - even other arrays

Creating an Array

- We create an array with

The diagram shows the function call `alloc_array(int, 5)`. Two blue callout boxes point to the arguments: the first points to `int` with the text "type of elements of the array", and the second points to `5` with the text "number of elements in the array".

```
alloc_array(int, 5)
```

- This returns an `int[]`, an array of 5 `int`'s

A screenshot of a Linux terminal window titled "Linux Terminal". The terminal shows the following interaction:

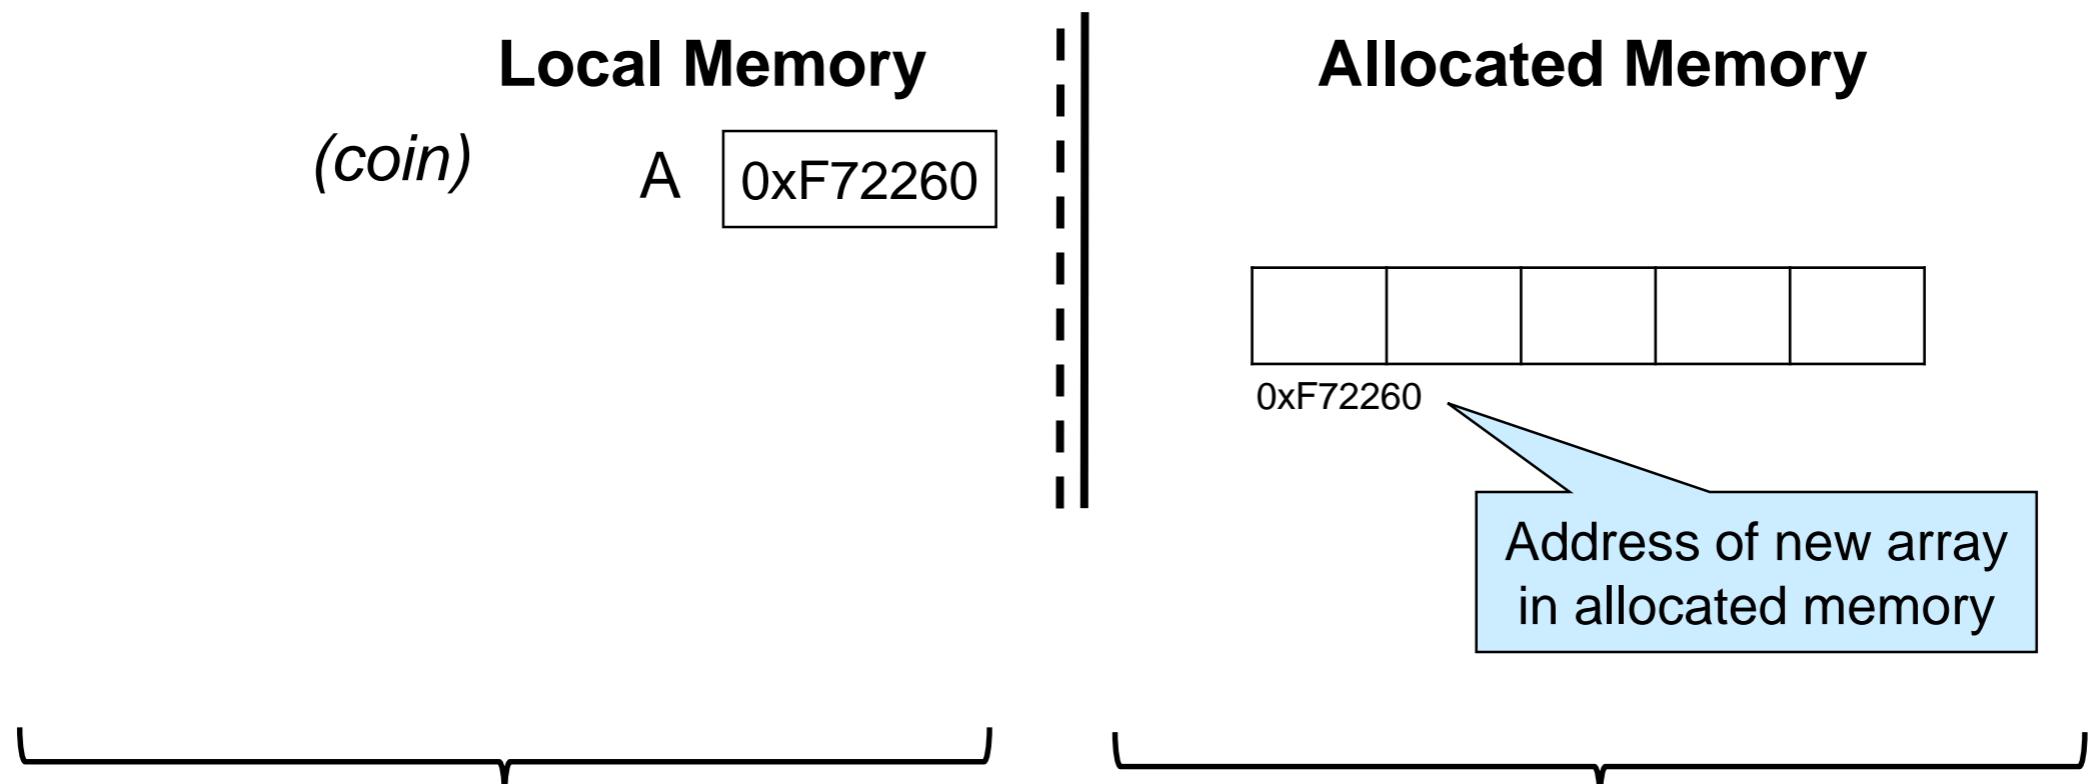

```
# coin
C0 interpreter (coin) ...
...
--> int[] A = alloc_array(int, 5);
A is 0xF72260 (int[] with 5 elements)
-->
```

The line `A is 0xF72260 (int[] with 5 elements)` is highlighted with a red oval. An arrow from a blue callout box below points to the memory address `0xF72260`.

This is a **memory address**

C0 Memory Model – Revisited

- Array contents live in **allocated memory**
 - A *new segment* of memory distinct from local memory
 - The variable A lives in local memory and
 - contains the address of the array in allocated memory

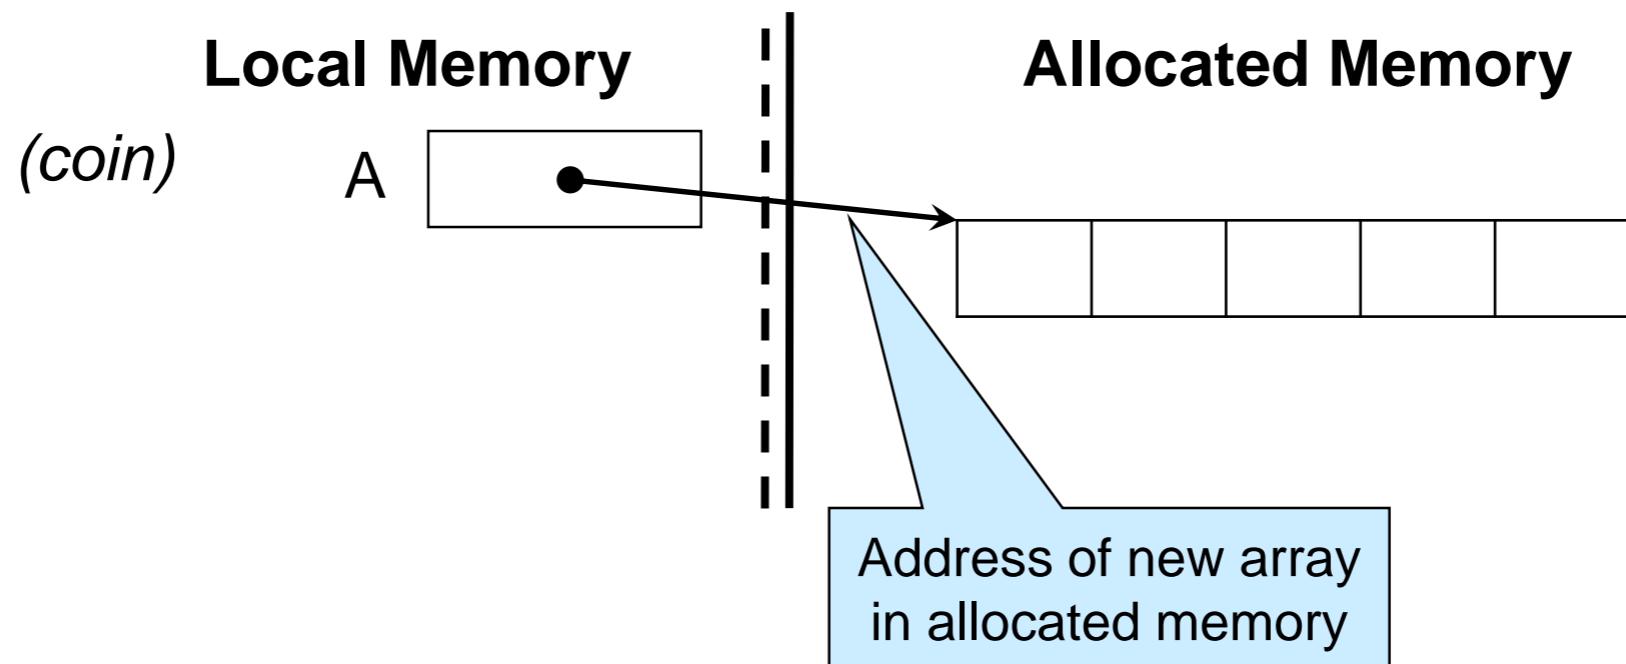

*Contains the values of local variables
int, bool, char, string, and addresses*

*Contains arrays themselves as we
create them using `alloc_array`*

C0 Memory Model – Revisited

- Array addresses are invisible to the programmer
 - Except in coin
 - Different runs may result in different addresses
- We often abstract them as arrows

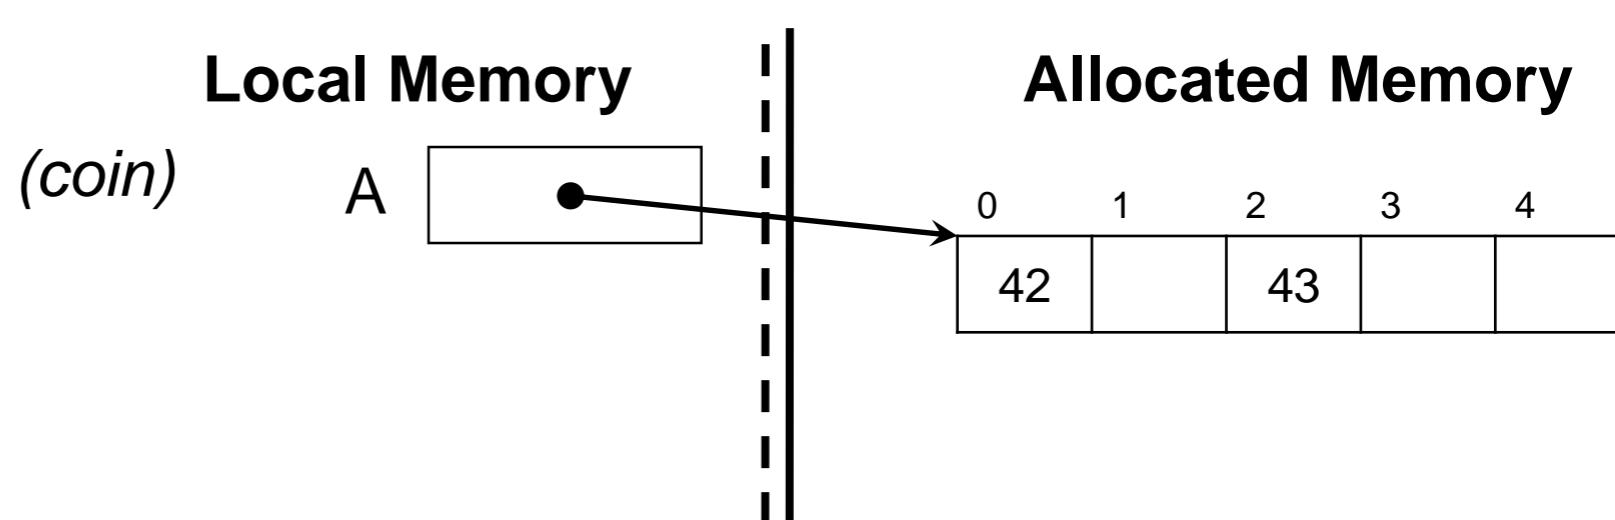

Accessing Array Elements

- i -th element of A is accessed as A[i]
 - Indices start at 0

Linux Terminal

```
--> A[0] = 42;  
A[0] is 42 (int)  
--> A[0];  
42 (int)  
--> A[2] = A[0] + 1;  
A[2] is 43 (int)
```

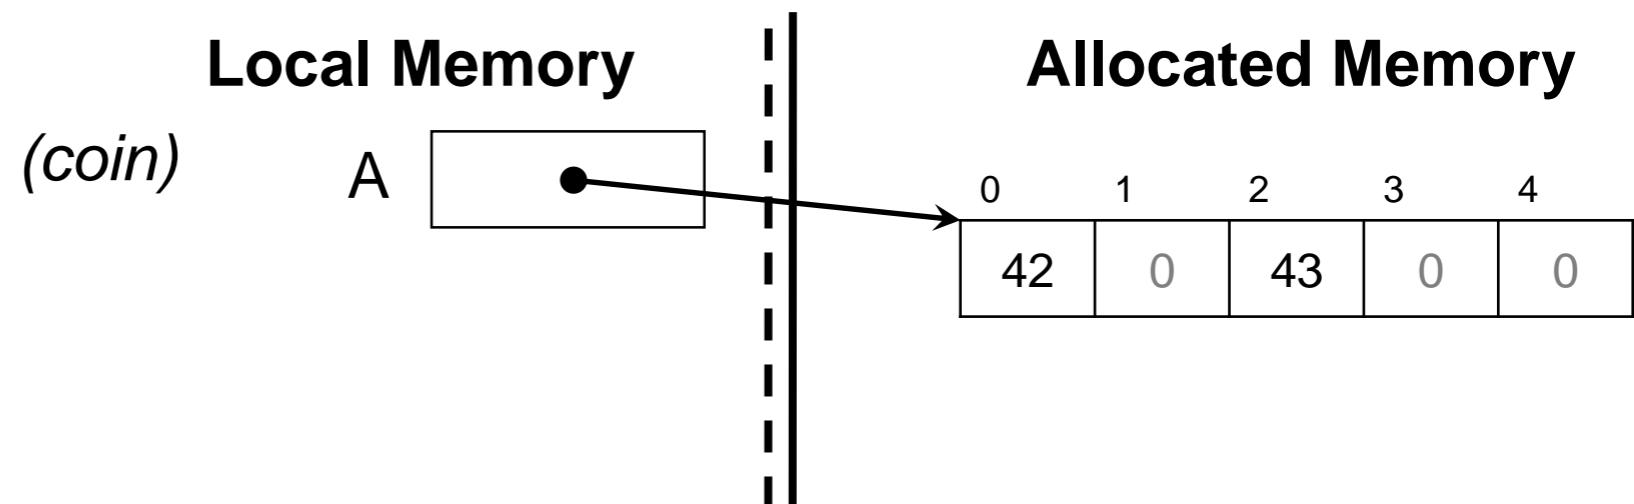

Accessing Array Elements

- Allocated memory is initialized with default values
 - 0 for `int`'s

Linux Terminal

```
--> A[1];
0 (int)
```

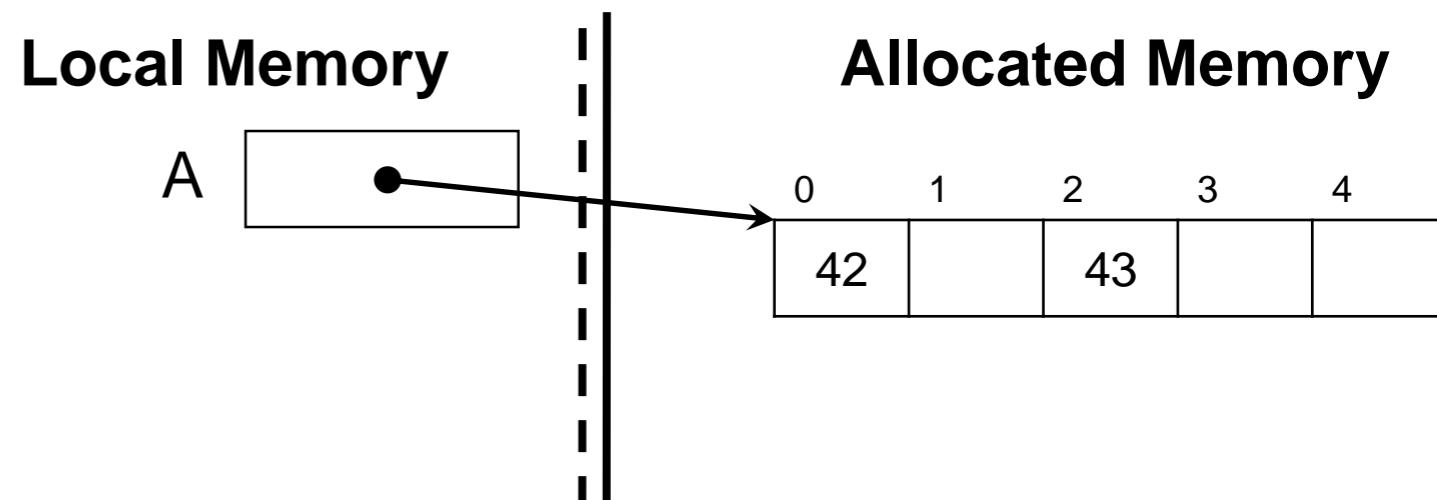

- For readability, we generally don't write default values

Out-of-bound Array Accesses

Linux Terminal

```
--> A[-1];
Error: accessing negative element in 5-element array
--> A[100];
Error: accessing element 100 in 5-element array
--> A[5];
Error: accessing element 5 in 5-element array
```

- Valid indices are only 0 up to length of the array
 - Anything else is **out of bounds**

Preconditions of Array Operations

- Out-of-bound array accesses are **unsafe**
- Array operations have preconditions

```
alloc_array(type, n)  
//@requires n ≥ 0;
```

```
A[i]  
//@requires 0 <= i && i < 'length of A';
```

- When using array operations, we must **prove** these preconditions are met
- Arrays can have length 0

Aliasing

Linux Terminal

```
--> int[] B = A;  
B is 0xF72260 (int[] with 5 elements)  
--> B[2] = 7;  
B[2] is 7 (int)  
--> A[2];  
7 (int)  
--> A == B;  
true (bool)
```

Local Memory

A	0xF72260
B	0xF72260

Allocated Memory

0	1	2	3	4
42		7		

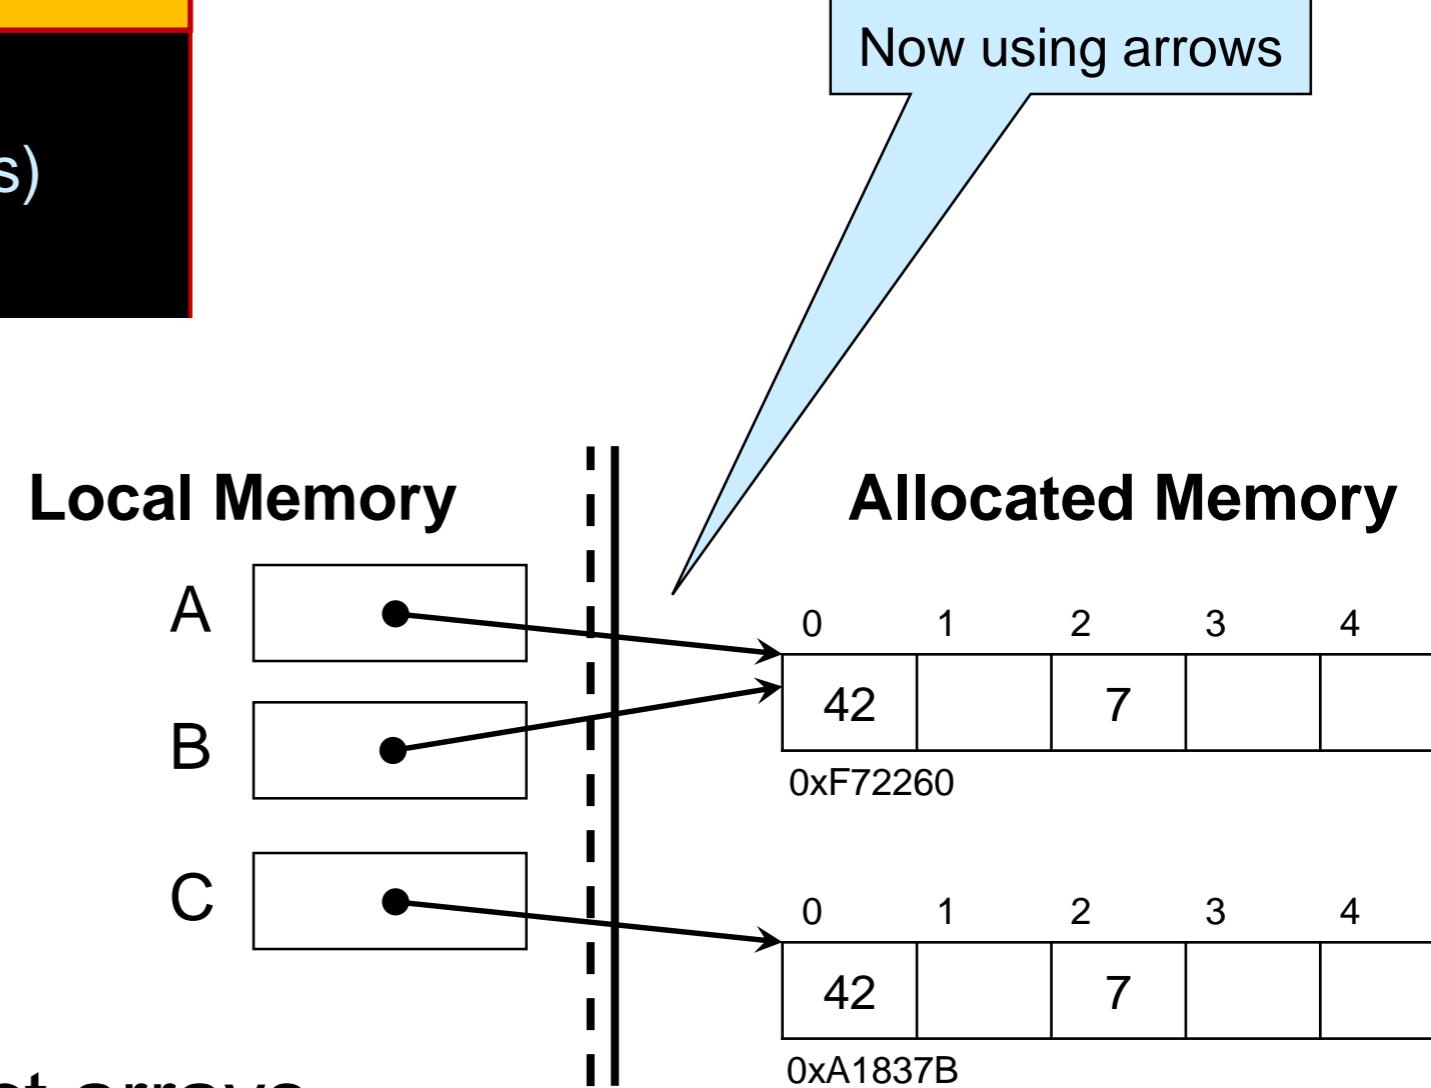

0xF72260

- A and B contain the same address
 - They refer to the *same array* in allocated memory
 - They are **aliases**
 - Modifying the array through one modifies it through the other

Aliasing

Linux Terminal

```
--> int[] C = alloc_array(int, 5);
C is 0xA1837B (int[] with 5 elements)
--> C[0] = 42;
C[0] is 42 (int)
--> C[2] = 7;
C[2] is 7 (int)
--> C == A;
false (bool)
```

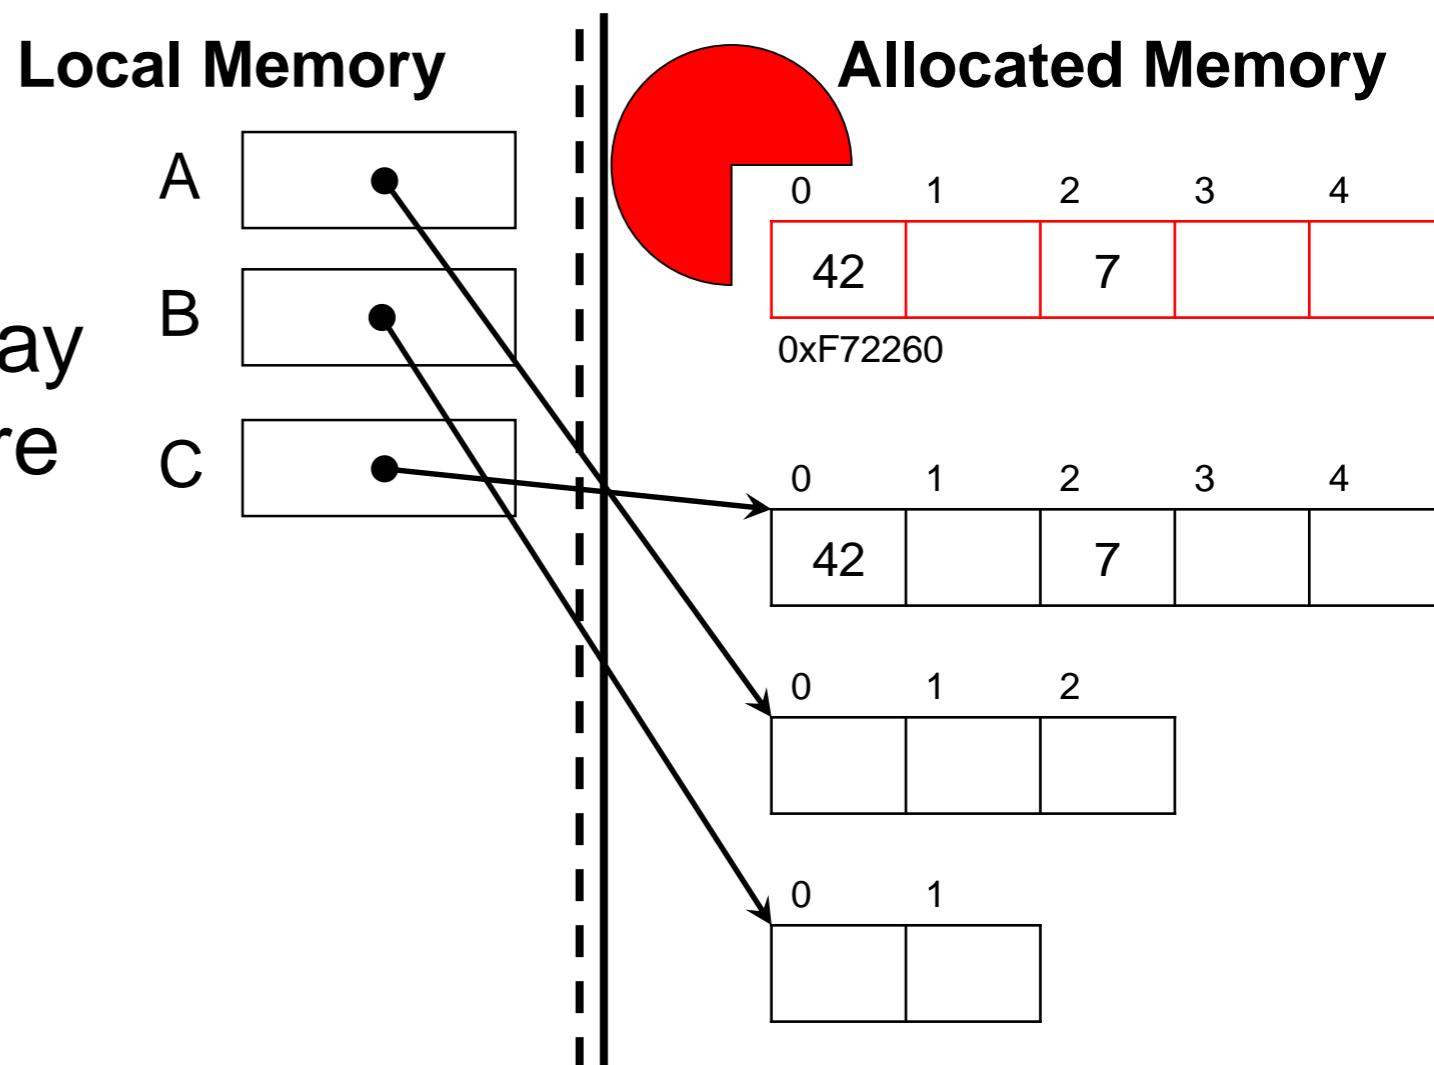

- A and C reference distinct arrays
 - which happen to have the same elements

Garbage Collection

Linux Terminal

```
--> A = alloc_array(int, 3);
A is 0xF722C0 (int[] with 3 elements)
--> B = alloc_array(int, 2);
B is 0xF722F0 (int[] with 2 elements)
```

- Elements of the initial array (at address 0xF72260) are inaccessible
 - It will be automatically **garbage-collected**

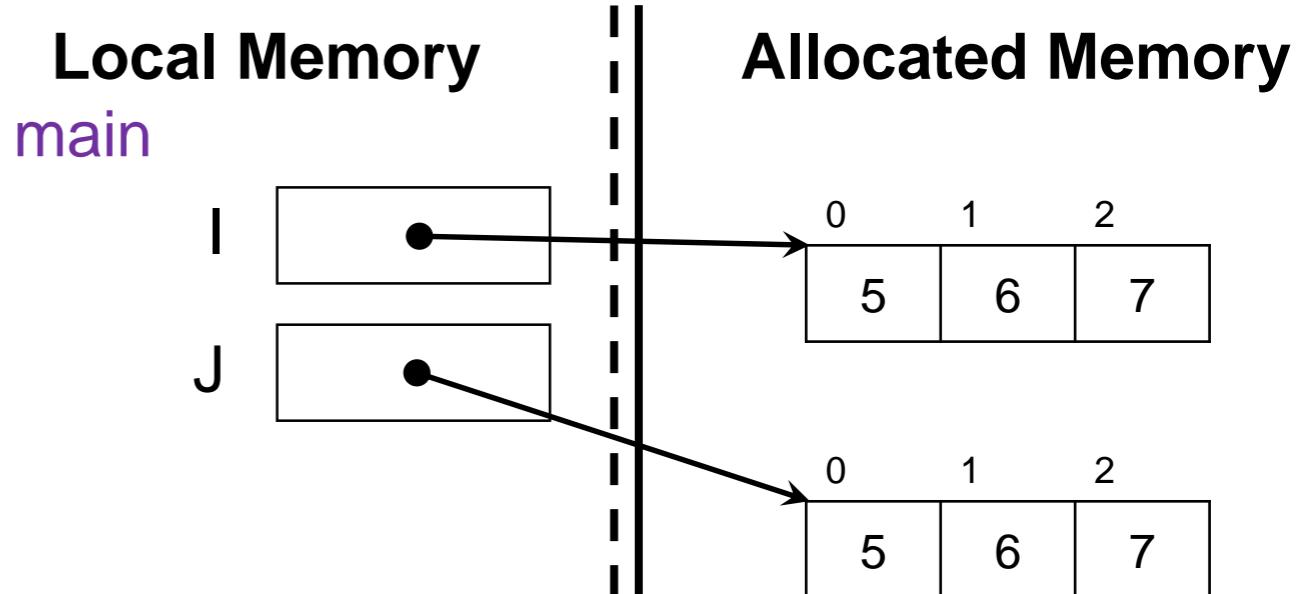

Coding with Arrays

array_copy

- We want to write a function, `array_copy`, that returns a new array with the same elements as the array passed to it
 - `array_copy` returns a *deep copy* of its input
➤ Not a alias!

```
int[] array_copy(int[] A) {  
    ...  
}  
  
int main() {  
    int[] I = ... [5, 6, 7] ...;  
    int[] J = array_copy(I);  
    return 0;  
}
```

Here →

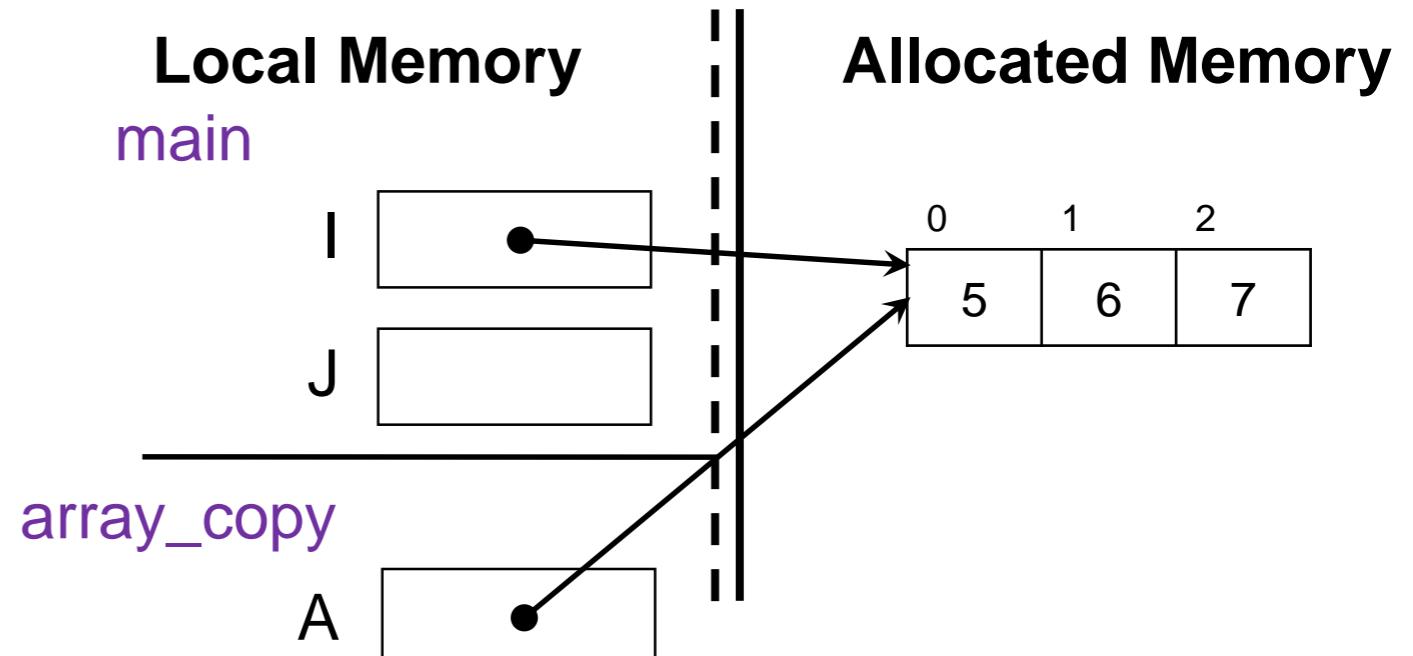

First Attempt

- Calling a function with an array
 - copies the **address** of the array into its parameter
- Returning an array from a function
 - returns the **address** of the array to the caller

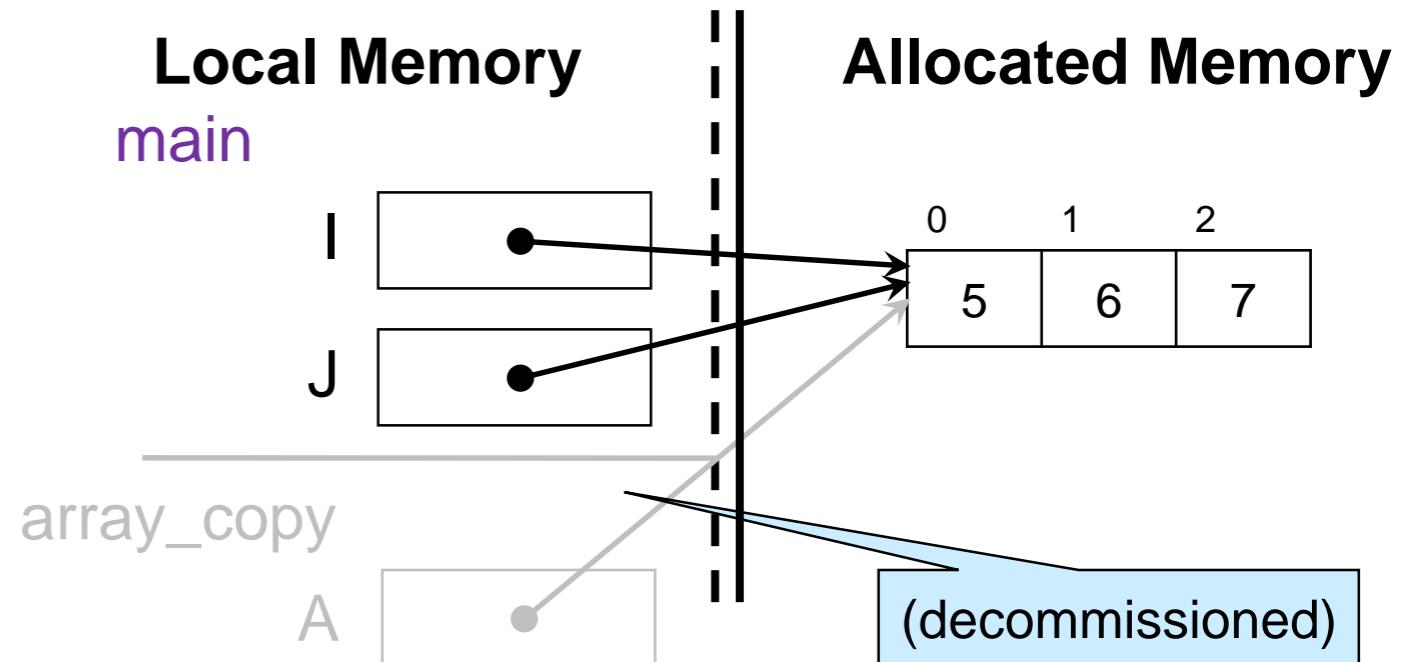

Here →

```
int[] array_copy(int[] A) {  
    return A;  
}  
  
int main() {  
    int[] I = ... [5, 6, 7] ...;  
    int[] J = array_copy(I);  
    return 0;  
}
```

First Attempt

```
int[] array_copy(int[] A) {  
    return A;  
}  
  
int main() {  
    int[] I = ... [5, 6, 7] ...;  
    int[] J = array_copy(I);  
    return 0;  
}
```

- We returned an *alias* to I
 - Not what we were aiming for!

Second Attempt

- `array_copy` needs to *allocate* a new array

```
int[] array_copy(int[] A) {
    int[] B = alloc_array(int, ??);
    ...
    return B;
}

int main() {
    int[] I = ... [5, 6, 7] ...;
    int[] J = array_copy(I);
    return 0;
}
```

- What length should B have?
 - There is **no way to get the length of an array in C0**
 - We need to pass it as an argument

Second Attempt

- Pass the length of A as a second argument

```
int[] array_copy(int[] A, int n) {
    int[] B = alloc_array(int, n);
    ...
    return B;
}

int main() {
    int[] I = ... [5, 6, 7] ...;
    int[] J = array_copy(I, 3);
    return 0;
}
```

- Is the call to **alloc_array** safe?

- No: we want $n \geq 0$
- Add precondition
`//@requires n >= 0;`

Second Attempt

- Is this enough to get the intended behavior?

- No: n should be the length of A
- But we can't get the length of an array

- Special **contract-only** function:

$\text{\length}(A)$

- Can **only** be used in contracts
- Evaluates to the length of A

```
int[] array_copy(int[] A, int n)
//@requires n == \length(A);
{
    int[] B = alloc_array(int, n);
    ...
    return B;
}

int main() {
    int[] I = ... [5, 6, 7] ...;
    int[] J = array_copy(I, 3);
    return 0;
}
```

Contracts of Array Operations

- We can now write strong contracts for the array operations
 - Better precondition of $A[i]$
 - Postcondition for **alloc_array**

```
alloc_array(type, n)
//@requires n >= 0;
//@ensures \length(\result) == n;
```

```
A[i]
//@requires 0 <= i && i < \length(A);
```

```
\length(A)
//@ensures \result >= 0;
```

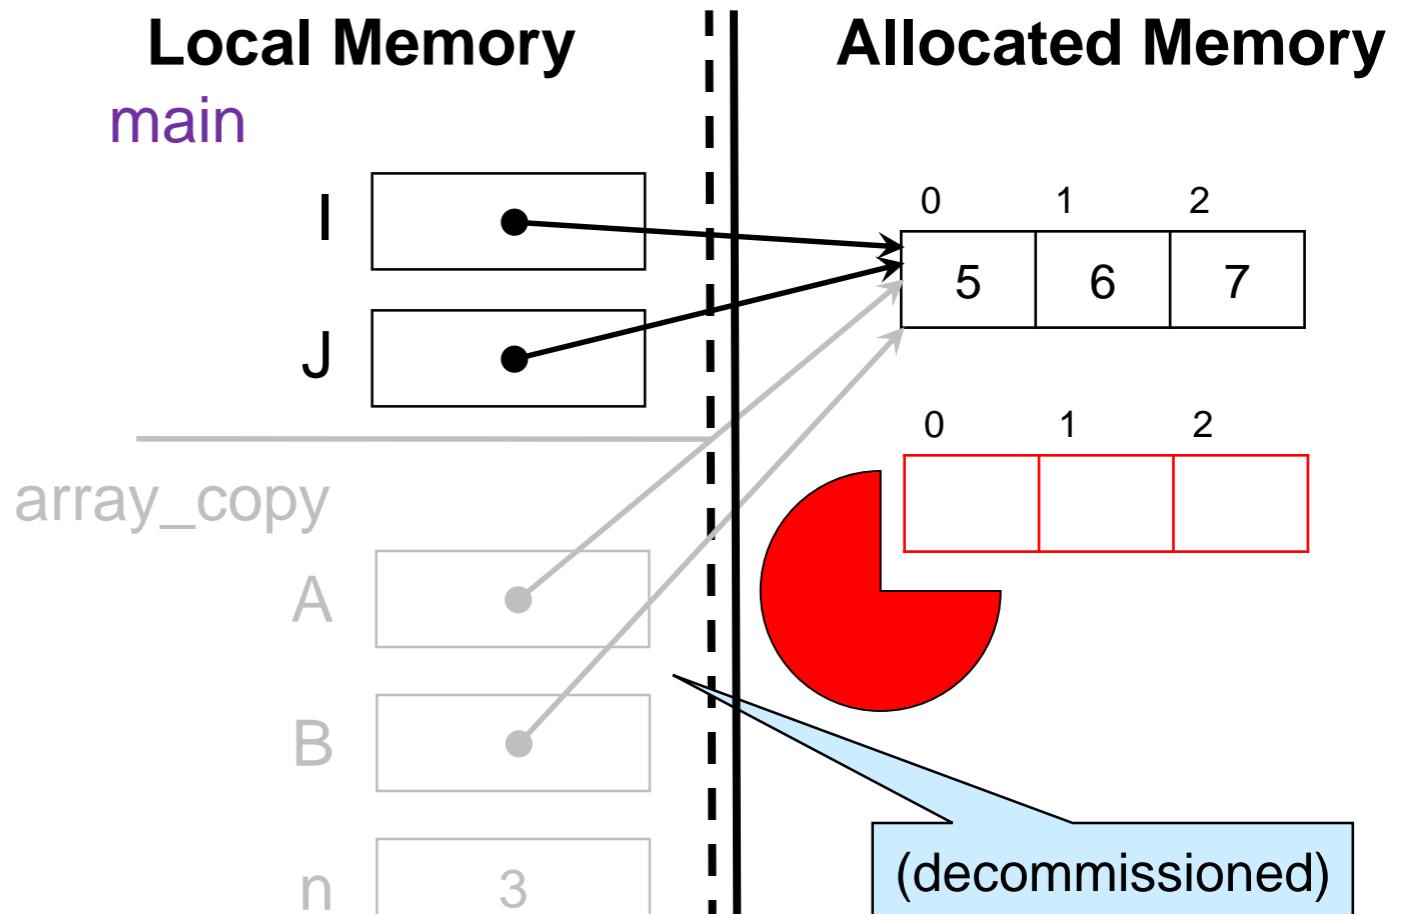

- We can use them in our proofs

Second Attempt

```
int[] array_copy(int[] A, int n)
//@requires n == \length(A);
{
    int[] B = alloc_array(int, n);
    B = A;
    return B;
}

int main() {
    int[] I = ... [5, 6, 7] ...
    int[] J = array_copy(I, 3);
    return 0;
}
```

Here →

- *B* is aliased to *A*
 - Newly allocated array is garbage collected
 - We return an *alias* to *I*

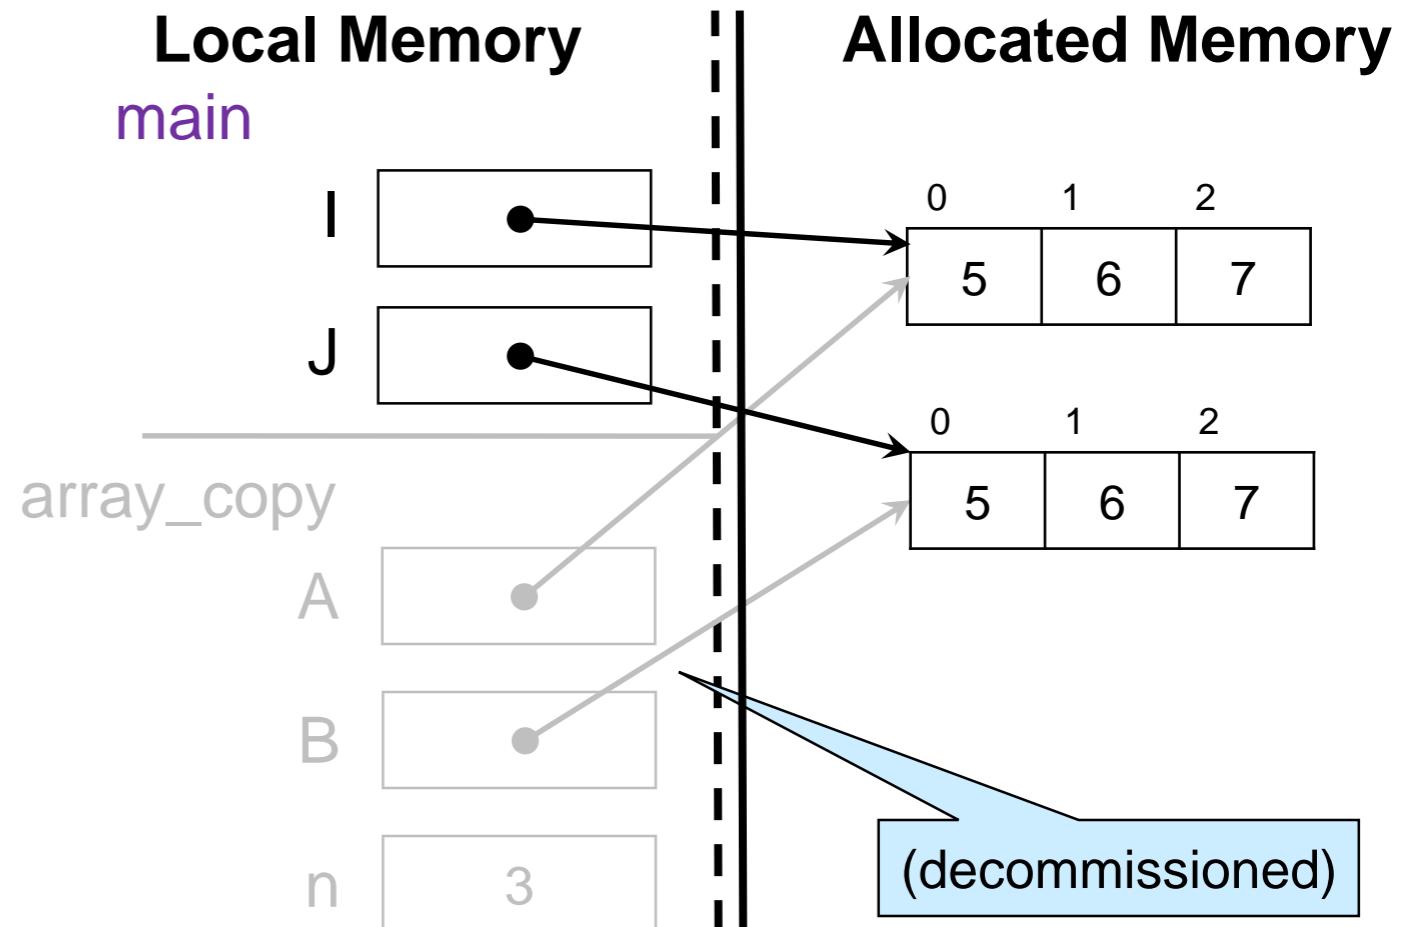

Third Attempt

```
int[] array_copy(int[] A , int n)
//@requires n == \length(A);
{
    int[] B = alloc_array(int, n);
    for (int i=0; i < n; i++) {
        B[i] = A[i];
    }
    return B;
}

int main() {
    int[] I = ... [5, 6, 7] ...;
    int[] J = array_copy(I, 3);
    return 0;
}
```

Here →

- Works as expected ✓
- **for**-loops are convenient to iterate through arrays
- Local variable *i* is only defined inside the loop

Safety of Array Code

Safety of array_copy

- Is `array_copy` safe?

- `alloc_array(int, n)` ?

- To show: $n \geq 0$

- $A[i]$?

- To show: $0 \leq i$

- and $i < \text{length}(A)$

- $B[i]$?

- To show: $0 \leq i$

- and $i < \text{length}(B)$

```
1. int[] array_copy(int[] A, int n)
2. //@requires n == \length(A);
3. {
4.     int[] B = alloc_array(int, n),
5.     for (int i=0; i < n; i++) {
6.         B[i] = A[i];
7.     }
8.     return B;
9. }
10.
11.int main() {
12.     int[] I = ... [5, 6, 7] ...;
13.     int[] J = array_copy(I, 3);
14.     return 0;
15.}
```

Safety of array_copy

alloc_array(int, n)

- To show: $n \geq 0$
- A. $n = \text{\length}(A)$ by line 2
- B. $\text{\length}(A) \geq 0$ by \length
- C. $n \geq 0$ by A and B

```
1. int[] array_copy(int[] A, int n)
2. //@requires n == \length(A);
3. {
4.     int[] B = alloc_array(int, n),
5.     for (int i=0; i < n; i++) {
6.         B[i] = A[i];
7.     }
8.     return B;
9. }
10.
11.int main() {
12.     int[] I = ... [5, 6, 7] ...;
13.     int[] J = array_copy(I, 3);
14.     return 0;
15.}
```

Safety of array_copy

A[i]

➤ To show: $i < \text{length}(A)$

- A. $n = \text{length}(A)$ by line 2
- B. $i < n$ by line 5
- C. $i < \text{length}(A)$ by A and B

➤ To show: $0 \leq i$

- “*i starts at 0 and is always incremented*”

➤ this is **operational reasoning**

- Nothing we can point to!

```
1. int[] array_copy(int[] A, int n)
2. //@requires n == \length(A);
3. {
4.     int[] B = alloc_array(int, n);
5.     for (int i=0; i < n; i++) {
6.         B[i] = A[i];
7.     }
8.     return B;
9. }
10.
11.int main() {
12.     int[] I = ... [5, 6, 7] ...;
13.     int[] J = array_copy(I, 3);
14.     return 0;
15.}
```

Safety of array_copy

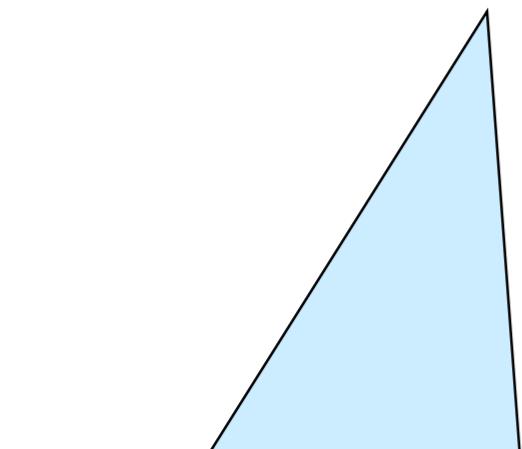

A[i]

➤ To show: $0 \leq i$

- Add it as a loop invariant
 - We will need to show it is valid

A. $0 \leq i$

by line 6

This is a common trick:

- if something is true by operational reasoning only
- turn it into a **contract** and prove it using point-to reasoning

```
1. int[] array_copy(int[] A, int n)
2. //@requires n == \length(A);
3. {
4.     int[] B = alloc_array(int, n);
5.     for (int i=0; i < n; i++)
6.         //@loop_invariant 0 <= i;
7.     {
8.         B[i] = A[i];
9.     }
10.    return B;
11. }
12.
13.int main() {
14.     int[] I = ... [5, 6, 7] ...
15.     int[] J = array_copy(I, 3);
16.     return 0;
17. }
```

Safety of array_copy

B[i]

➤ To show: $0 \leq i \&& i < \text{\length}(B)$

- Left as exercise

```
1. int[] array_copy(int[] A, int n)
2. //@requires n == \length(A);
3. {
4.     int[] B = alloc_array(int, n);
5.     for (int i=0; i < n; i++)
6.         //@loop_invariant 0 <= i;
7.     {
8.         B[i] = A[i];
9.     }
10.    return B;
11. }
12.
13.int main() {
14.     int[] I = ... [5, 6, 7] ...;
15.     int[] J = array_copy(I, 3);
16.     return 0;
17. }
```

Validity of the Loop Invariant

//@loop_invariant $0 \leq i$;

INIT:

➤ To show: $0 \leq i$ initially

- A. $i = 0$ by line 5
- B. $0 \leq 0$ by math
- C. $0 \leq i$ by A and B

```
1. int[] array_copy(int[] A, int n)
2. //@requires n == \length(A);
3. {
4.     int[] B = alloc_array(int, n);
5.     for (int i=0; i < n; i++)
6.         //@loop_invariant 0 <= i;
7.     {
8.         
9.     }
10.    return B;
11. }
12.
13.int main() {
14.     int[] I = ... [5, 6, 7] ...;
15.     int[] J = array_copy(I, 3);
16.     return 0;
17. }
```

Validity of the Loop Invariant

//@loop_invariant $0 \leq i$;

PRES: $0 \leq i$ is preserved

➤ **To show:** if $0 \leq i$, then $0 \leq i'$

- A. $i' = i+1$ by line 5
- B. $0 \leq i$ assumption
- C. $0 \leq i+1$ by math on B
 - only if $i \neq \text{int_max}()$* by two's compl.
- D. $i < n$ by line 5
- E. $i \neq \text{int_max}()$ by math on D
- F. $0 \leq i'$ by A, C and E

```
1. int[] array_copy(int[] A, int n)
2. //@requires n == \length(A);
3. {
4.     int[] B = alloc_array(int, n);
5.     for (int i=0; i < n; i++)
6.         //@loop_invariant  $0 \leq i$ ;
7.     {
8.         B[i] = A[i];
9.     }
10.    return B;
11. }
12.
13.int main() {
14.     int[] I = ... [5, 6, 7] ...;
15.     int[] J = array_copy(I, 3);
16.     return 0;
17. }
```

Safety of Calls to `array_copy`

Is `array_copy(I, 3)` safe?

➤ To Show: $3 = \text{\length}(I)$

A. $\text{\length}(I) = 3$ by line 14

```
1. int[] array_copy(int[] A, int n)
2. //@requires n == \length(A);
3. {
4.
5.
6.
7.
8.
9.
10.    I = ...
11. }
12.
13.int main() {
14.    int[] I = alloc_array(int, 3);
15.    ... [5, 6, 7] ...
16.    int[] J = array_copy(I, 3); (circled)
17.    int[] K = array_copy(J, 3);
18.    return 0;
19.}
```

Safety of Calls to `array_copy`

Is `array_copy(J, 3)` safe?

- To Show: $3 = \text{\length}(J)$
- “*array_copy creates an array of the same length as its input*”
 - Looks at the code of a different function
 - This is **operational reasoning!**
 - We can only look at the *contracts* of other functions

- Add a postcondition to `array_copy`

Our trick again:

- if something is true by operational reasoning only
- turn it into a **contract** and prove it using point-to reasoning

```
1. int[] array_copy(int[] A, int n)
2. //@requires n == \length(A);
3. {
4.
5.
6.
7.
8.
9.
10. int[] K = array_copy(J, 3);
11. }
12.
13.int main() {
14.   int[] I = alloc_array(int, 3);
15.   ... [5, 6, 7] ...
16.   int[] J = array_copy(I, 3);
17.   int[] K = array_copy(J, 3);
18.   return 0;
19. }
```

Safety of Calls to `array_copy`

Is `array_copy(J, 3)` safe?

➤ To Show: $3 = \text{\length}(J)$

- A. $\text{\length}(I) = 3$ by line 15
- B. $\text{\length}(J) = 3$ by lines 3 and 17
- C. $3 = \text{\length}(J)$ by A and B

```
1. int[] array_copy(int[] A, int n)
2. //@requires n == \length(A);
3. //@ensures n == \length(\result);
4. {
5.     ...
6. }
11.
12.}
13.
14.int main() {
15.     int[] I = alloc_array(int, 3);
16.     ... [5, 6, 7] ...
17.     int[] J = array_copy(I, 3);
18.     int[] K = array_copy(J, 3);
19.     return 0;
20.}
```

A large blue cloud icon is centered on the right side of the slide, containing several lines of C code. Some lines are circled in red, specifically line 3 and line 17.

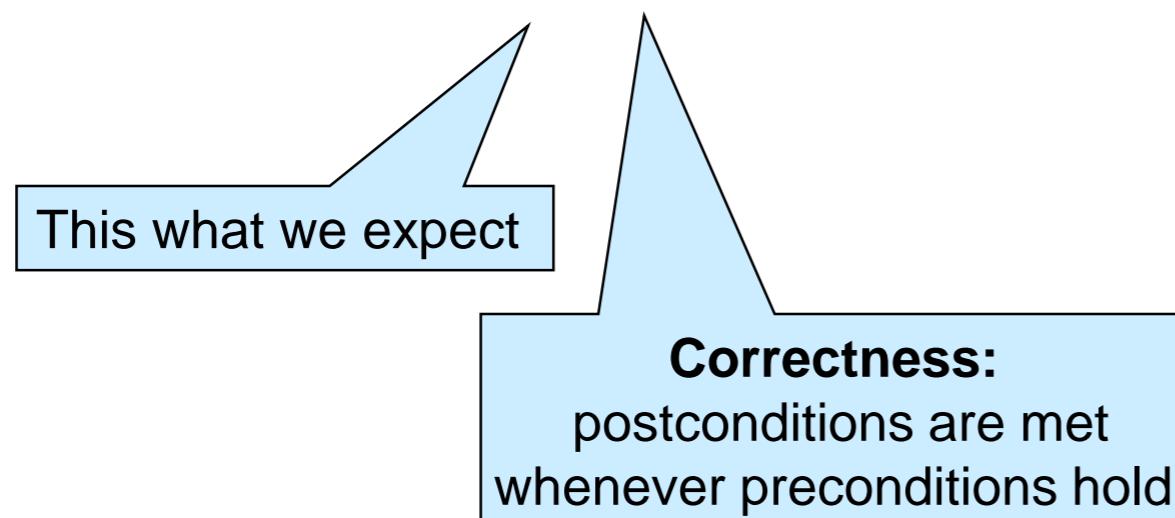

Is array_copy correct?

➤ To Show: if $n = \text{\length}(A)$,
then $n = \text{\length}(\text{\result})$

- A. $\text{\length}(B) = n$ by line 5
- B. $\text{\result} = B$ by line 11
- C. $n = \text{\length}(\text{\result})$ by A and B

- Does B contain the same elements as A in the same order?

```
1. int[] array_copy(int[] A, int n)
2. //@requires n == \length(A);
3. //@ensures n == \length(\result);
4. {
5.     int[] B = alloc_array(int, n);
6.     for (int i=0; i < n; i++)
7.         //@loop_invariant 0 <= i;
8.     {
9.         B[i] = A[i];
10.    }
11.    return B;
12. }
13.
14.int main() {
15. ...
16. }
```

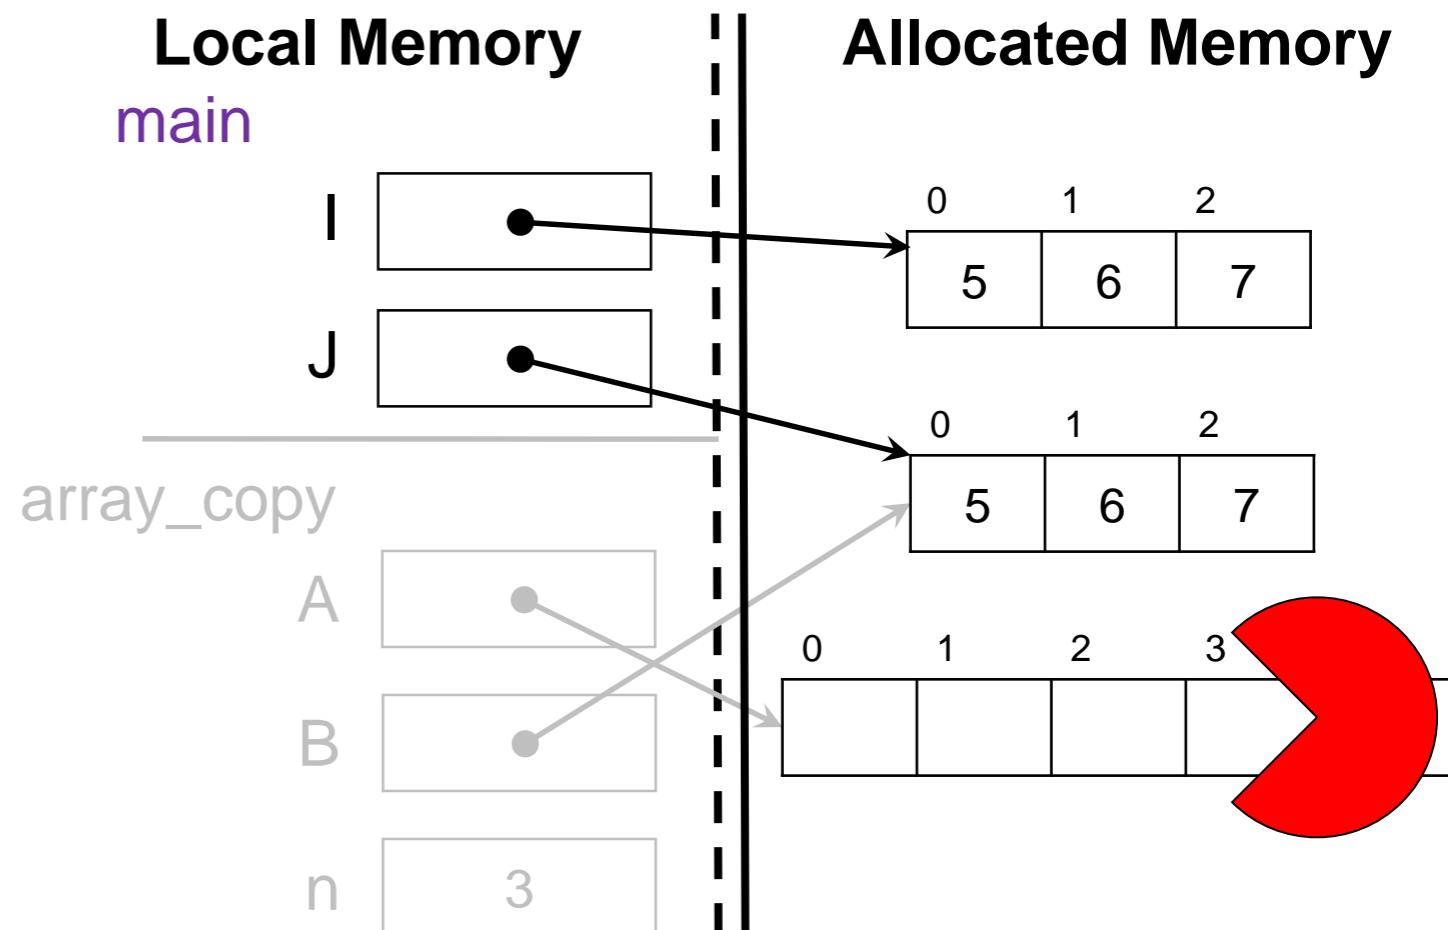

Effects of Array Code

Modifying Parameters

```
int[] array_copy(int[] A, int n)
//@requires n == \length(A);
//@ensures n == \length(\result);
{
    int[] B = alloc_array(int, n);
    for (int i=0; i < n; i++)
        //@loop_invariant 0 <= i;
    {
        B[i] = A[i];
    }
    A = alloc_array(int, 5); A = alloc_array(int, 5);
    return B;
}

int main() {
    int[] I = ... [5, 6, 7] ...;
    int[] J = array_copy(I, 3);
    return 0;
}
```

Here →

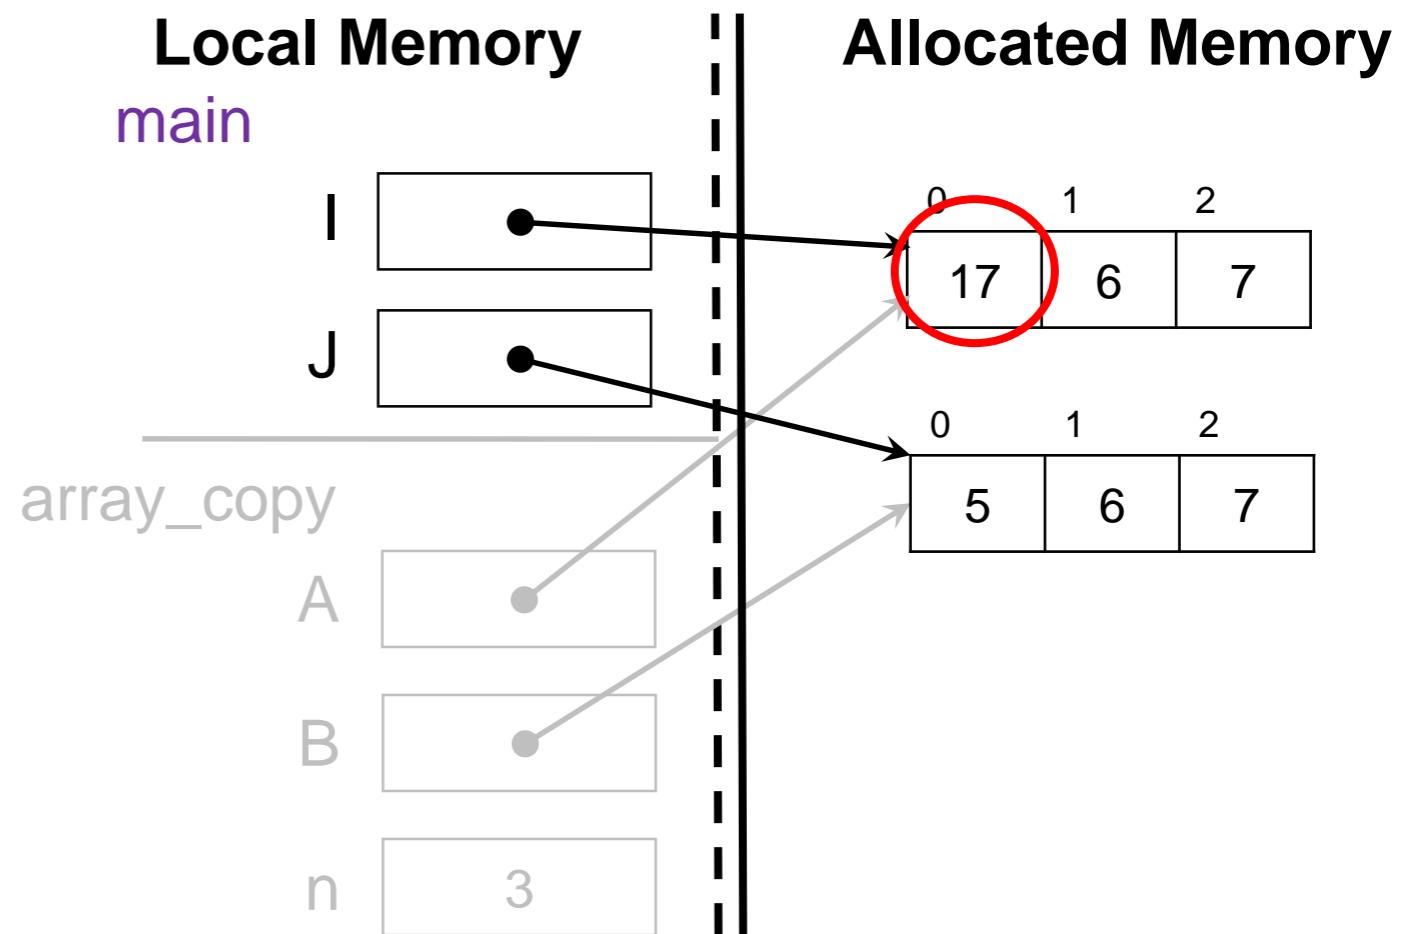

- Only the value of `A` in `array_copy` changes
 - The value of `I` is unchanged
 - The change is **not visible to caller**

Modifying Array elements

```
int[] array_copy(int[] A , int n)
//@requires n == \length(A);
//@ensures n == \length(\result);
{
    int[] B = alloc_array(int, n);
    for (int i=0; i < n; i++)
        //@loop_invariant 0 <= i;
    {
        B[i] = A[i];
    }
    if (n > 0) A[0] = 17;
    return B;
}

int main() {
    int[] I = ... [5, 6, 7] ...
    int[] J = array_copy(I, 3);
    return 0;
}
```

Here →

- The array contents is **shared** between caller and callee
 - The value of I[0] is changed
 - The change is **visible to caller**
