# Warm-up

Design an algorithm to determine the winner of three candidates a, b, c given the ranking provided by n individual voters, described by a  $3 \times n$  matrix M

#### function voting(*M*)

Input: M where  $M_{ij} \in \{a, b, c\}$  is the candidate at rank j for voter i Output:  $x \in \{a, b, c\}$  describes the winner

#### Example Matrix M

	Josef Josef	y ver	v o	) Joet X
Rank 1	a	С	b	a
Rank 2	b	b	С	b
Rank 3	С	а	а	С

Return *x* 

### Announcements

### Feedback (please don't forget!):

- www.cmu.edu/hub/fce
- https://www.ugrad.cs.cmu.edu/ta/F23/feedback/

### Assignments:

- HW10 due tonight
- P5 due Thursday night

#### Final Exam:

- All material is fair game, will focus disproportionately on material not yet covered on midterm exams
- Look at post on Piazza with instructions

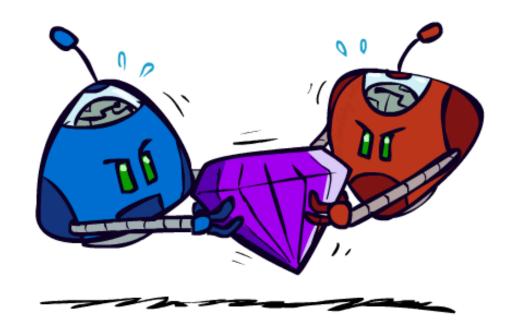

# BONUS assignment

Bonus assignment on voting (will be released tonight) so you get some practice

Relatively light assignment, instant feedback, but not due until right before final exam

# AI: Representation and Problem Solving

# Game Theory: Equilibrium (cont) & Social Choice

Instructors: Vincent Conitzer and Aditi Raghunathan

Slide credits: CMU AI, Fei Fang

### Normal-Form Games

### A game in normal form consists of the following elements

- Set of players
- Set of actions for each player
- Payoffs / Utility functions
  - Determines the utility for each player given the actions chosen by all players (referred to as action profile)
- Bimatrix game is special case: two players, finite action sets

Players move simultaneously and the game ends immediately afterwards

### Practice for later

What is the Mixed Strategy Nash Equilibrium for this new problem?

#### Berry

Football	4,1	0,0
Concert	0,0	3,3

Alex

# Solution Concepts in Games

How should one player play and what should we expect all the players to play?

- Dominant strategy and dominant strategy equilibrium
- Nash Equilibrium
- Minimax strategy
- Maximin strategy
- Stackelberg Equilibrium

### Power of Commitment

What are the PSNEs in this game, and the players' utilities?

What action should player 2 choose if player 1 commits to playing b? What is player 1's utility?

What action should player 2 choose if player 1 commits to playing a and b uniformly randomly? What is player 1's expected utility?

		Playe	er 2
(1/2).4+(1/2)3=3.5		С	d
// /er 1	а	2,1	4,0
Playe	b	1,0	3,2

# Stackelberg Equilibrium

### Stackelberg Game

- Leader commits to a strategy first
- Follower responds after observing the leader's strategy

### Stackelberg Equilibrium

- Follower best responds to leader's strategy
- Leader commits to a strategy that maximizes her utility assuming follower best responds

Player 2

	С	d
а	2,1	4,0
b	1,0	3,2

# Stackelberg Equilibrium

If the leader can only commit to a pure strategy, or you know that the leader's strategy in equilibrium is a pure strategy, the equilibrium can be found by enumerating the leader's pure strategies

If ties for the follower are broken by the follower such that the leader benefits, the leader can exploit this. This is the strong Stackelberg equilibrium (SSE)

In general, the leader can commit to a mixed strategy and in that case, for the leader:  $u^{SSE} \ge u^{NE}$  (first-mover advantage)! & solvable by linear programming! [Conitzer & Sandholm 2006, von Stengel and Zamir 2010; see also Prof. Fei Fang's work here at CMU (on the following slides)]

# Protecting Staten Island Ferry

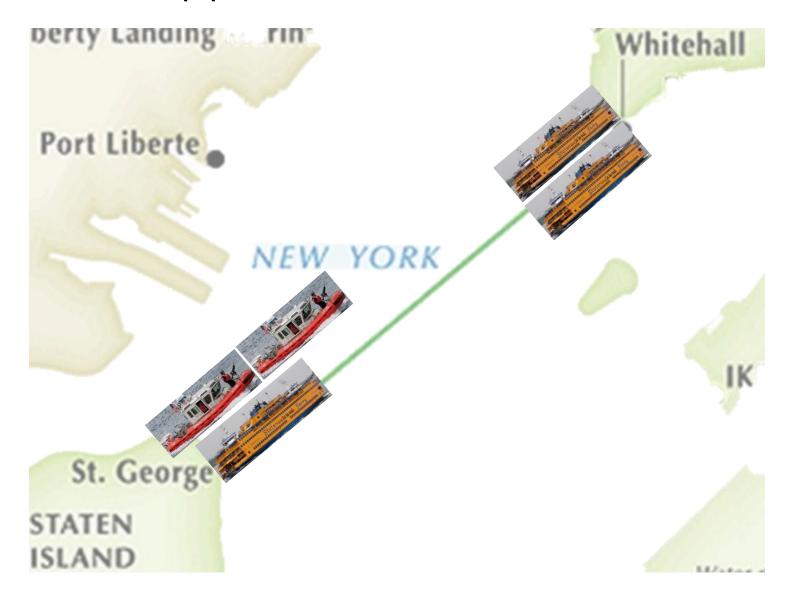

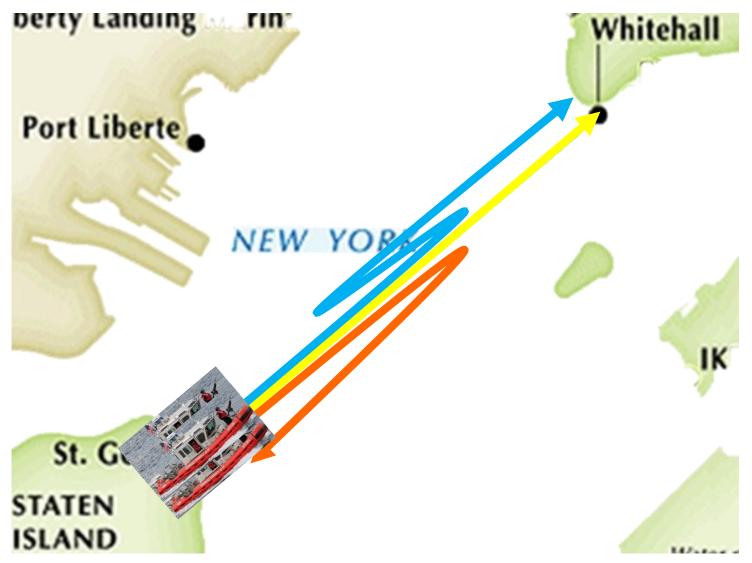

# Protecting Staten Island Ferry

# Previous USCG Approach

## Problem

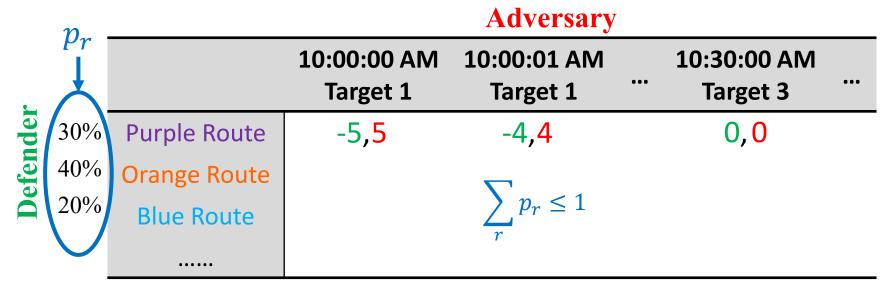

# Game Model and Linear Programming-based Solution

Stackelberg game: Leader – Defender, Follower – Attacker

Attacker's payoff:  $u_i(t)$  if not protected, 0 otherwise

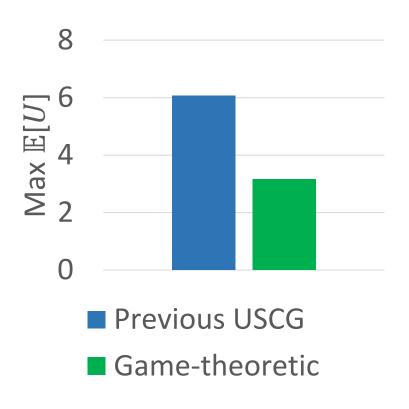

Zero-sum → Strong Stackelberg Equilibrium=Nash Equilibrium = Minimax (Minimize Attacker's Maximum Expected Utility)

$$\min_{p_r,v} v$$
 s.t.  $v \ge \mathbb{E}[U^{att}(i,t)] = u_i(t) \times \mathbb{P}[unprotected(i,t)], \forall i,t$ 

### Evaluation: Simulation & Real-World Feedback

### Reduce potential risk by 50%

### Deployed by US Coast Guard

#### **USCG** evaluation

- Point defense to zone defense
- Increased randomness

#### **Professional mariners:**

Apparent increase in Coast Guard patrols Game Theory: Social Choice

# Warm-up

Design an algorithm to determine the winner of three candidates a, b, c given the ranking provided by n individual voters, described by a  $3 \times n$  matrix M

#### function voting(*M*)

Input: M where  $M_{ij} \in \{a, b, c\}$  is the candidate at rank j for voter i Output:  $x \in \{a, b, c\}$  describes the winner

Example Matrix M

Amartya Kumar Sen

# **Voting Model**

#### Model

- Set of voters  $N = \{1...n\}$
- Set of alternatives A(|A| = m)
- Each voter has a ranking over the alternatives
- Preference profile: collection of all voters' rankings

Voter ID	1	2	3	4
Ranking	a	С	b	a
	b	b	С	b
	С	а	а	С

Voting rule: function that maps preference profiles to alternatives that specifies the winner of the election

#### function voting(*M*)

Input: M where  $M_{ij} \in \{a, b, c\}$  is the candidate at rank j for voter i

Output:  $x \in \{a, b, c\}$  describes the winner

#### Example Matrix M

а	С	b	а
b	b	С	b
С	а	а	С

Return *x* 

### Plurality (used in many political elections)

- Each voter gives one point to top alternative
- Alternative with most points wins

#### Who's the winner? a

Voter ID	1	2	3	4
Ranking	а	С	b	a
	b	b	С	b
	С	а	а	С

### Borda count (used for national election in Slovenia)

- Each voter awards m-k points to alternative ranked  $k^{th}$
- Alternative with most points wins

#### Who's the winner? b

Voter ID	1	2	3	4
Ranking	а	С	b	а
	b	b	С	b
	С	а	a	С

a: 
$$2+2=4$$

b:  $1+1+2+1=5$ 

c:  $2+1=3$ 

### Borda count (used for national election in Slovenia)

- Each voter awards m-k points to alternative ranked  $k^{th}$
- Alternative with most points wins

Who's the winner? b

Voter ID	1	2	3	4	m-k
Ranking	а	С	b	а	2
	b	b	С	b	1
	С	а	a	С	0

a: 2+0+0+2=4; b: 1+1+2+1=5; c: 0+2+1+0=3

### Pairwise Election

Alternative x beats y in pairwise election if majority of voters prefer x to y

Who beats who in pairwise election?

b beats c

Voter ID	1	2	3	4
Ranking	а	С	b	а
	b	b	С	b
	С	a	a	С

### Plurality with runoff

- First round: two alternatives with highest plurality scores survive
- Second round: pairwise election between the two

x beats y if majority of voters prefer x to y

#### Who's the winner?

Voter ID	1	2	3	4	5
Ranking	а	(C)	<b>∕</b> b	а	(C)
	b	b	C	b	b
	С	a	а	С	а

### Plurality with runoff

- First round: two alternatives with highest plurality scores survive
- Second round: pairwise election between the two

x beats y if majority of voters prefer x to y

Who's the winner?

a and c survive, and then c beats a

Voter ID	1	2	3	4	5
Ranking	а	С	b	а	С
	b	b	С	b	b
	С	а	а	С	а

### Single Transferable Vote (STV)

- (used in Ireland, Australia, New Zealand, Maine, San Francisco, Cambridge)
- lacktriangledown m-1 rounds: In each round, alternative with least plurality votes is eliminated
- Alternative left is the winner

#### Who's the winner?

Voter ID	1	2	3	4	5
Ranking	a	ø	b	а	b
	b	b	e	b	ď
	ď	e	а	et	а
	K	а	ď	ç	¢′

### Single Transferable Vote (STV)

- (used in Ireland, Australia, New Zealand, Maine, San Francisco, Cambridge)
- $\blacksquare m-1$  rounds: In each round, alternative with least plurality votes is eliminated
- Alternative left is the winner

Who's the winner? c is eliminated, then d, then a, leaving b as the winner.

Voter ID	1	2	3	4	5
Ranking	а	d	b	а	b
	b	b	С	b	d
	d	С	а	d	а
	С	а	d	С	С

Note: When d is eliminated, the vote from voter 2 is effectively transferred to b

# Representation of Preference Profile

Identity of voters does not matter

Only record how many voters has a preference

33 voters	16 voters	3 voters	8 voters	18 voters	22 voters
а	b	С	С	d	е
b	d	d	e	e	С
С	С	b	b	С	b
d	е	a	d	b	d
е	a	е	a	a	а

# Tie Breaking

### Commonly used tie breaking rules include

- Borda count
- Having the most votes in the first round
- **-** ...

### Social Choice Axioms

How do we choose among different voting rules? What are the desirable properties?

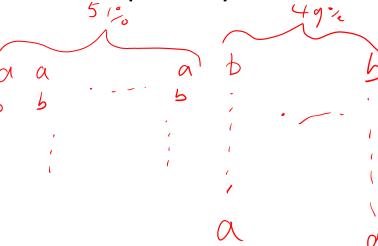

# Majority consistency

Majority consistency: Given a voting rule that satisfies Majority Consistency, if a majority of voters (> 50% of voters) rank alternative x first, then x should be the final winner.

### Poll 1

### Which rules are NOT majority consistent?

- A. Plurality: Each voter give one point to top alternative
- $\vee$  B. Borda count: Each voter awards m-k points to alternative ranked  $k^{th}$ 
  - C. Plurality with runoff: Pairwise election between two alternatives with highest plurality scores
  - D. STV: In each round, alternative with least plurality votes is eliminated
  - E. None

# Condorcet Consistency

Recall: x beats y in a pairwise election if majority of voters prefer x to y

Condorcet winner is an alternative that beats every other alternative in pairwise election

Does a Condorcet winner always exist?

Condorcet paradox = cycle in majority preferences

Voter ID	1	2	3	
Ranking over alternatives (first row is the most preferred)	а	С	b	
	b	а	С	
	С	b	а	

# Condorcet Consistency: a Condorcet winner should always win

If a rule satisfies majority consistency, does it satisfy Condorcet consistency? Vice versa?

Which of the introduced voting rules (Plurality, Borda count, Plurality with runoff, STV) are Condorcet consistent?

### Poll 2

#### Which rules ARE Condorcet consistent?

- A. Plurality: Each voter give one point to top alternative
- B. Borda count: Each voter awards m-k points to alternative ranked  $k^{th}$
- C. Plurality with runoff: Pairwise election between two alternatives with highest plurality scores
- D. STV: In each round, alternative with least plurality votes is eliminated
- E. None

## Condorcet Consistency

#### Winner under different voting rules in this example

- Plurality:
- Borda:
- Plurality with runoff:
- STV:
- Condorcet winner:

33 voters	16 voters	3 voter	8 voters	18 voters	22 voters
а	b	С	С	d	е
b	d	d	е	e	С
С	С	b	b	С	b
d	е	а	d	b	d
е	а	е	а	а	а

# Strategy-Proofness

### **Using Borda Count**

#### Who is the winner?

Voter ID	1	2	3	m-k
Ranking over alternatives (first row is the most preferred)	b	b	a	3
	a	а	b	2
	С	С	С	1
	d	d	d	0

#### Who is the winner now?

Voter ID	1	2	3	m-k
Ranking over alternatives (first row is the most preferred)	b	b	a	3
	a	а	С	2
	С	С	d	1
	d	d	b	0

## Strategy-Proofness

#### A single voter can manipulate the outcome!

Voter ID	1	2	3	m-k
Ranking over alternatives (first row is the most preferred)	b	b	а	3
	a	а	b	2
	С	С	С	1
	d	d	d	0

b is the winner

Voter ID	1	2	3	
Ranking over alternatives (first row is the most preferred)	b	b	а	
	a	а	С	
	С	С	d	
	d	d	b	

m-k
3
2
1
0

a is the winner

## Strategy-Proofness

A voting rule is strategyproof (SP) if a voter can never benefit from lying about his preferences (regardless of what other voters do)

Benefit: a more preferred alternative is selected as winner

Do not lie: b is the winner Lie: a is the winner

Voter ID	1	2	3
Ranking	b	b	а
	а	а	b
	С	С	С
	d	d	d

Voter ID	1	2	3
Ranking	b	b	а
	a	a	С
	С	С	d
	d	d	b

If a voter's preference is a>b>c, c will be selected w/o lying, and b will be selected w/lying, then the voter still benefits

### Poll 3

#### Which of the introduced voting rules are strategyproof?

- A. Plurality: Each voter give one point to top alternative
- igotimes B. Borda count: Each voter awards m-k points to alternative ranked  $k^{th}$ 
  - C. Plurality with runoff: Pairwise election between two alternatives with highest plurality scores
  - D. STV: In each round, alternative with least plurality votes is eliminated
  - E. None

### Greedy Algorithm for f —Manipulation

Given voting rule f and preference profile of n-1 voters, how can the last voter report preference to let a specific alternative y uniquely win (no tie breaking)?

#### Greedy algorithm for f —Manipulation

```
Rank y in the first place
While there are unranked alternatives
If \exists x that can be placed in the next spot without preventing y from winning
place this alternative in the next spot
else
return false
return true (with final ranking)
```

Correctness proved (Bartholdi et al., 1989)

# Greedy Algorithm for f —Manipulation

### Example with Borda count voting rule

Voter ID	1	2	3	
Ranking over alternatives	b	b	a	
(first row is the most preferred)	a	a		
preferred	С	С		
	d	d		

### Other Properties

A voting rule is dictatorial if there is a voter who always gets their most preferred alternative

A voting rule is constant if the same alternative is always chosen (regardless of the stated preferences)

A voting rule is onto if any alternative can win, for some set of stated preferences

Which of the introduced voting rules (Plurality, Borda count, Plurality with runoff, STV) are dictatorial, constant or onto?

### Results in Social Choice Theory

Constant functions and dictatorships are SP Why?

Theorem (Gibbard-Satterthwaite): If  $m \geq 3$ , then any voting rule that is SP and onto is dictatorial

- Any voting rule that is onto and nondictatorial is manipulable
- It is impossible to have a voting rule that is strategyproof, onto, and nondictatorial

Activity: Favorite topics of 15281 (by approval voting)

## Learning Objectives

Understand the voting model

Find the winner under the following voting rules

Plurality, Borda count, Plurality with runoff, Single Transferable Vote

Describe the following concepts, axioms, and properties of voting rules

- Pairwise election, Condorcet winner
- Majority consistency, Condorcet consistency, Strategyproof
- Dictatorial, constant, onto

Understand the possibility of satisfying multiple properties

Describe the greedy algorithm for voting rule manipulation
