P3, P4

Dave Eckhardt
de0u@andrew.cmu.edu

Outline

- P3 grading approach
- Coping with P3 disasters
- P4

P3 Grading Approach

- Substantially according to "Plan of Attack"
- *Key milestone: does the shell run?*
  - virtual memory, system call boundary, context switch
  - fork(), exec()
  - wait(), exit()
  - readline() [basic]
  - Functional, if limited, maybe-unstable, OS

P3 Grading Approach

- Semi-automatic test environment
  - Kernel booted
  - Shell calls "magic" readline
  - Simics used to simulate command line
  - Single test runs
  - Second call to readline shuts down kernel

Approximate Breakdown

Item	Value
Shell runs	65.00%
Basic tests	10.00%
Solidity tests	10.00%
Threads	7.00%
Structure/Style	8.00%

P3 Disasters?

- Some groups seem not "done"
    - One or more conceptual problems
    - Time management issues
    - Merge failures
    - "Out of gas"

P3 Disasters

- P3 is *central* to this class
    - Pedagogically, you should finish it
    - Very difficult to do a kernel extension (P4) w/o P3
    - Potential exam trouble
- Some people have asked about withdrawing
- I'd prefer finishing to withdrawing...

What I Can Offer

- An additional week

  - We do need to *grade* these...

    - Including interviews

- The bad news...

  - This extra P3 time will preclude P4

- How to decide?

  - Educational goal: understanding core principles

  - "Hurdle" model

P3 Hurdle

- Test suite to be released around midnight
  - After "P3 clock" has run out for 3-late-day groups
  - Basic tests – essentially what was already released
  - Solidity tests – subset of grading suite
- "Self-grade" by running them yourselves
- If you pass, register on "P4 registration page"
- Otherwise
  - P4 grade = 0%; late P3 may end up with mild penalty

Moving Forward

- ***Read your partner's code***
  - – Regardless of whether you made the deadline!
  - – You need to understand the whole thing
    - Even if time constraints mean you can't write your own
- Think about what happened
  - – Maybe <u>write down</u> what you will do differently
- ***Plan time wisely***
  - – ...based on your painfully-won self-knowledge

P4 Projects

- Paging – we will provide IDE disk driver

- File system

  – Read-only is ok

  – Simplified format ok (e.g., FAT)

  – One option: turn "executable RAM disk" into r/o fs

- Console extensions

  – Multiple virtual consoles, hot-key swap

  – "System monitor" line at bottom of display

Icing on the cake?

- Try your kernel on real hardware

  – So you can amaze your friends & family

- Not unusual for there to be some glitch

  – Uninitialized variable

    - Real PC may have different RAM contents than simics PC

  – Clock interrupt happens too early

Lecture Topic Survey (Pick 3?)

- Remote file systems
- Distributed time & agreement
- Exotic operating system designs
- Naming in the Internet
- Mobile code
- Transactions
- PGP key-signing party?
