

Neural Networks

1. Introduction Spring 2019

Neural Networks are taking over!

- Neural networks have become one of the major thrust areas recently in various pattern recognition, prediction, and analysis problems
- In many problems they have established the state of the art
 - Often exceeding previous benchmarks by large margins

Breakthroughs with neural networks

The screenshot shows a web browser displaying a TechNewsWorld article. The browser's address bar shows the URL www.technewsworld.com/story/84013.html. The page header includes the TechNewsWorld logo, the section 'EMERGING TECH', and a search bar. Below the header is a navigation menu with categories like Computing, Internet, IT, Mobile Tech, Reviews, Security, Technology, and Tech Blog. The main article title is 'Microsoft AI Beats Humans at Speech Recognition' by Richard Adhikari, dated Oct 20, 2016. The article features a central image of a hand touching a hexagonal grid with 'AI' in the center, surrounded by terms like Reasoning, Computer, Knowledge, and Learning. To the left of the image are social sharing buttons for Google+, Twitter, Facebook, LinkedIn, YouTube, and a general share button. To the right, there are social media icons for Facebook, Twitter, LinkedIn, Google+, SoundCloud, and RSS, along with options for 'Most Popular', 'Newsletters', and 'News Alerts'. Below these is a poll titled 'How do you feel about Black Friday and Cyber Monday?' with five radio button options and a 'Vote to See Results' button. Further down, there are several article teasers under the heading 'E-Commerce Times', including 'Black Friday Shoppers Hungry for New Experiences, New Tech', 'Pay TV's Newest Innovation: Giving Users Control', 'Apple Celebrates Itself in \$300 Coffee Table Tome', 'AWS Enjoys Top Perch in IaaS, PaaS Markets', and 'US Comptroller Gears Up for Blockchain and...'. The article text below the image reads: 'Microsoft's Artificial Intelligence and Research Unit earlier this week reported that its speech recognition technology had surpassed the performance of human transcriptionists.'

AI

Image: Adobe Stock

Microsoft's Artificial Intelligence and Research Unit earlier this week reported that its speech recognition technology had surpassed the performance of human transcriptionists.

How do you feel about Black Friday and Cyber Monday?

- They're great -- I get a lot of bargains!
- The deals are too spread out -- I'd prefer just one day.
- They're a fun way to kick off the holiday season.
- I don't like the commercialization of Thanksgiving Day.
- They're crucial for the retail industry and the economy.
- The deals typically aren't that good.

Breakthroughs with neural networks

Figure 1: Training *AlphaZero* for 700,000 steps. Elo ratings were computed from evaluation games between different players when given one second per move. **a** Performance of *AlphaZero* in chess, compared to 2016 TCEC world-champion program *Stockfish*. **b** Performance of *AlphaZero* in shogi, compared to 2017 CSA world-champion program *Elmo*. **c** Performance of *AlphaZero* in Go, compared to *AlphaGo Lee* and *AlphaGo Zero* (20 block / 3 day) (29).

Success with neural networks

- Captions generated entirely by a neural network

Successes with neural networks

- And a variety of other problems:
 - From art to astronomy to healthcare..
 - and even predicting stock markets!

Neural nets can do anything!

Neural nets and the employment market

This guy didn't know about neural networks (a.k.a deep learning)

This guy learned about neural networks (a.k.a deep learning)

Objectives of this course

- Understanding neural networks
- Comprehending the models that do the previously mentioned tasks
 - And maybe build them
- Familiarity with some of the terminology
 - What are these:
 - <http://www.datasciencecentral.com/profiles/blogs/concise-visual-summary-of-deep-learning-architectures>
- Fearlessly design, build and train networks for various tasks
- *You will not become an expert in one course*

Course learning objectives:

Broad level

- Concepts
 - Some historical perspective
 - Types of neural networks and underlying ideas
 - Learning in neural networks
 - Training, concepts, practical issues
 - Architectures and applications

 - Will try to maintain balance between squiggles and concepts (concept >> squiggle)
- Practical
 - Familiarity with training
 - Implement various neural network architectures
 - Implement state-of-art solutions for some problems
- Overall: Set you up for further research/work in your research area

Course learning objectives: **Topics**

- Basic network formalisms:
 - MLPs
 - Convolutional networks
 - Recurrent networks
 - Boltzmann machines
- Some advanced formalisms
 - Generative models: VAEs
 - Adversarial models: GANs
- Topics we will touch upon:
 - Computer vision: recognizing images
 - Text processing: modelling and generating language
 - Machine translation: Sequence to sequence modelling
 - Modelling distributions and generating data
 - Reinforcement learning and games
 - Speech recognition

Reading

- List of books on course webpage
- Additional reading material also on course pages

Instructors and TAs

- Instructor: Me
 - bhiksha@cs.cmu.edu
 - x8-9826
- TAs:
 - List of TAs, with email ids on course page
 - We have TAs for the
 - Pitt Campus
 - Kigali,
 - SV campus,
 - Please approach your local TA first
- Office hours: On webpage
- <http://deeplearning.cs.cmu.edu/>

Logistics

- Most relevant info on website
 - Including schedule
- Short video with course logistics up on youtube
 - Link on course page
 - Please watch: Quiz includes questions on logistics
- Repeating some of it here..

Logistics: Lectures..

- Have in-class and online sections
 - Including online sections in Kigali and SV
- Lectures are being streamed
- Recordings will also be put up and links posted
- Important that you view the lectures
 - Even if you think you know the topic
 - Your marks depend on viewing lectures

Lecture Schedule

- On website
 - The schedule for the latter half of the semester may vary a bit
 - Guest lecturer schedules are fuzzy..
- Guest lectures:
 - TBD
 - Scott Fahlman, Mike Tarr, ...

Recitations

- We will have 13 recitations
 - May have a 14th if required
- Will cover implementation details and basic exercises
 - Very important if you wish to get the maximum out of the course
- Topic list on the course schedule
- *Strongly recommend attending all recitations*
 - *Even if you think you know everything*

Quizzes and Homeworks

- 14 Quizzes
 - Will retain best 12
- Four homeworks
 - Each has two parts, one on autolab, another on Kaggle
 - Deadlines and late policies in logistics lecture and on the course website
- Hopefully you have already tried the practice HWs over summer
 - Will help you greatly with the course
- Hopefully you have also seen recitation 0 and are working on HW 0

Lectures and Quizzes

- Slides often contain a lot more information than is presented in class
- *Quizzes will contain questions from topics that are on the slides, but not presented in class*
- *Will also include topics covered in class, but not on online slides!*

This course is not easy

- A lot of work!

This course is not easy

- A lot of work!
- *A lot of work!!*

This course is not easy

- A lot of work!
- *A lot of work!!*
- ***A lot of work!!!***

This course is not easy

- A lot of work!
- *A lot of work!!*
- ***A lot of work!!!***
- ***A LOT OF WORK!!!!***

Not for chicken!

This course is not easy

- A lot of work!
- *A lot of work!!*
- ***A lot of work!!!***
- ***A LOT OF WORK!!!!***
- *Mastery-based* evaluation
 - Quizzes to test your understanding of topics covered in the lectures
 - HWs to teach you to implement complex networks
 - And optimize them to high degree
- **Target: Anyone who gets an “A” in the course is technically ready for a deep learning job**

Questions?

- Please post on piazza

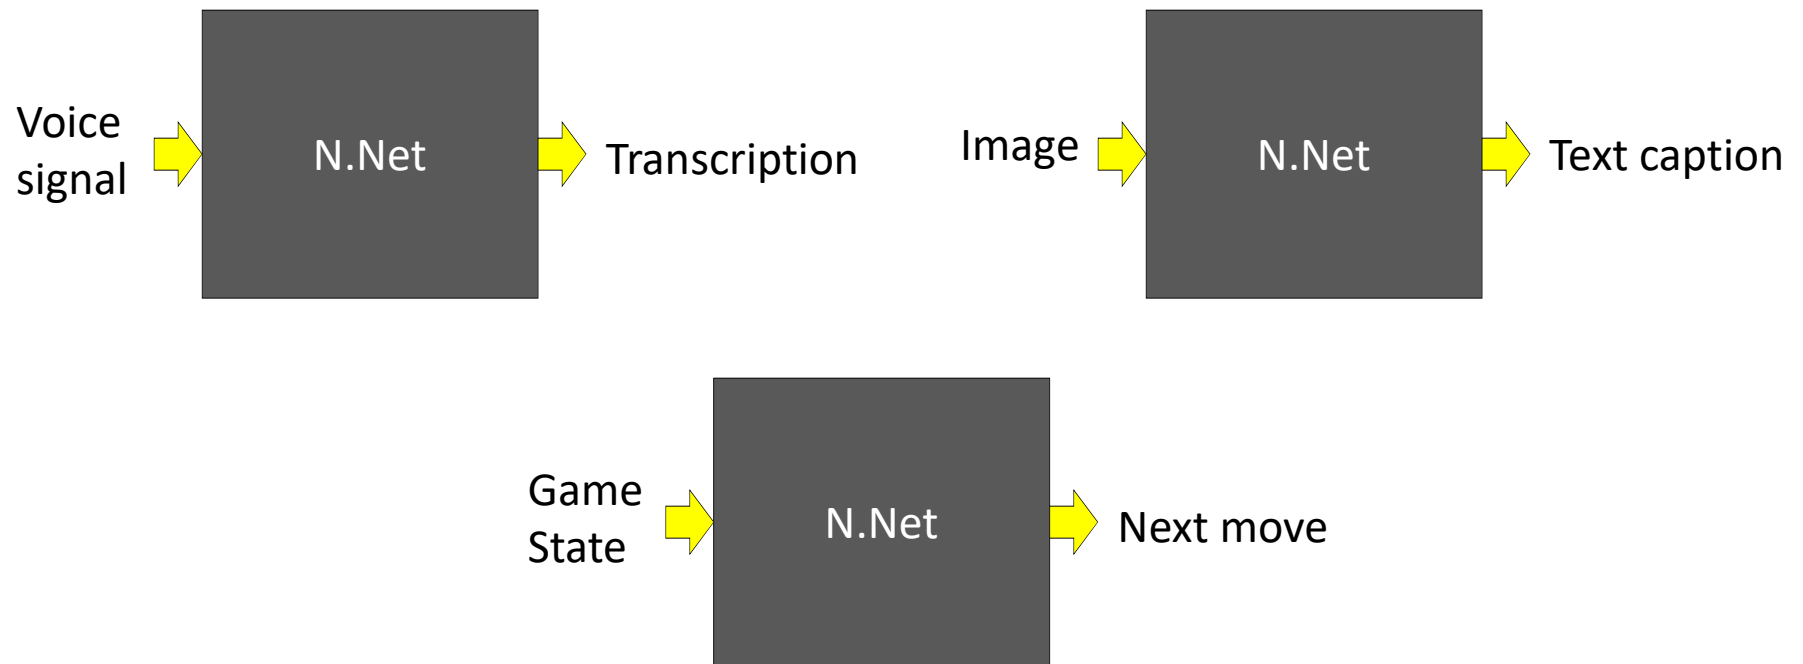

Perception: From Rosenblatt, 1962..

- "Perception, then, emerges as that relatively primitive, partly autonomous, institutionalized, ratiomorphic subsystem of cognition which achieves prompt and richly detailed orientation habitually concerning the vitally relevant, mostly distal aspects of the environment on the basis of mutually vicarious, relatively restricted and stereotyped, insufficient evidence in uncertainty-gearred interaction and compromise, seemingly following the highest probability for smallness of error at the expense of the highest frequency of precision. "
 - From "Perception and the Representative Design of Psychological Experiments, " by Egon Brunswik, 1956 (posthumous).
- "That's a simplification. Perception is standing on the sidewalk, watching all the girls go by."
 - From "The New Yorker", December 19, 1959

Onward..

So what are neural networks??

- What are these boxes?

So what are neural networks??

- It begins with this..

So what are neural networks??

"The Thinker!"
by Augustin Rodin

- Or even earlier.. with this..

The magical capacity of humans

- Humans can
 - Learn
 - Solve problems
 - Recognize patterns
 - Create
 - Cogitate
 - ...
- Worthy of emulation
- But how do humans “work“?

Dante!

Cognition and the brain..

- “If the brain was simple enough to be understood - we would be too simple to understand it!”
 - Marvin Minsky

Early Models of Human Cognition

- **Associationism**
 - Humans learn through association
- **400BC-1900AD:** Plato, David Hume, Ivan Pavlov..

What are “Associations”

- Lightning is generally followed by thunder
 - Ergo – “hey here’s a bolt of lightning, we’re going to hear thunder”
 - Ergo – “We just heard thunder; did someone get hit by lightning”?
- Association!

A little history : Associationism

- Collection of ideas stating a basic philosophy:
 - “Pairs of thoughts become associated based on the organism’s past experience”
 - **Learning** is a mental process that forms associations between temporally related phenomena
- 360 BC: Aristotle
 - "Hence, too, it is that we hunt through the mental train, excogitating from the present or some other, and from similar or contrary or coadjacent. Through this process reminiscence takes place. For the movements are, in these cases, sometimes at the same time, sometimes parts of the same whole, so that the subsequent movement is already more than half accomplished."
 - In English: *we memorize and rationalize through association*

Aristotle and Associationism

- Aristotle's four laws of association:
 - *The law of contiguity.* Things or events that occur close together in space or time get linked together
 - *The law of frequency.* The more often two things or events are linked, the more powerful that association.
 - *The law of similarity.* If two things are similar, the thought of one will trigger the thought of the other
 - *The law of contrast.* Seeing or recalling something may trigger the recollection of something opposite.

A little history : **Associationism**

- More recent associationists (upto 1800s): John Locke, David Hume, David Hartley, James Mill, John Stuart Mill, **Alexander Bain**, Ivan Pavlov
 - Associationist theory of mental processes: *there is only one mental process: the ability to associate ideas*
 - Associationist theory of learning: *cause and effect, contiguity, resemblance*
 - Behaviorism (early 20th century) : *Behavior is learned from repeated associations of actions with feedback*
 - Etc.

- **But where are the associations stored??**
- **And how?**

But how do we *store* them?

Dawn of Connectionism

David Hartley's *Observations on man* (1749)

- We receive input through vibrations and those are transferred to the brain
- Memories could also be small vibrations (called vibratiuncles) in the same regions
- Our brain represents compound or connected ideas by connecting our memories with our current senses
- Current science did not know about neurons

Observation: *The Brain*

- Mid 1800s: The brain is a mass of interconnected neurons

Brain: Interconnected Neurons

- Many neurons connect *in* to each neuron
- Each neuron connects *out* to many neurons

Enter *Connectionism*

- Alexander Bain, philosopher, psychologist, mathematician, logician, linguist, professor
- **1873: The information is in the *connections***
 - *Mind and body* (1873)

Enter: Connectionism

Alexander Bain (*The senses and the intellect* (1855), *The emotions and the will* (1859), *The mind and body* (1873))

- In complicated words:
 - Idea 1: The “nerve currents” from a memory of an event are the same but reduce from the “original shock”
 - Idea 2: “for every act of memory, ... there is a specific grouping, or co-ordination of sensations ... *by virtue of specific growths in cell junctions*”

Bain's Idea 1: Neural Groupings

- Neurons excite and stimulate each other
- Different combinations of inputs can result in different outputs

Bain's Idea 1: Neural Groupings

- Different intensities of activation of A lead to the differences in when X and Y are activated
- Even proposed a learning mechanism..

Bain's Idea 2: Making Memories

- “when two impressions concur, or closely succeed one another, the nerve-currents find some bridge or place of continuity, better or worse, according to the abundance of nerve-matter available for the transition.”
- Predicts “Hebbian” learning (three quarters of a century before Hebb!)

Bain's Doubts

- *“The fundamental cause of the trouble is that in the modern world the stupid are cocksure while the intelligent are full of doubt.”*
 - Bertrand Russell
- In 1873, Bain postulated that there must be one million neurons and 5 billion connections relating to 200,000 “acquisitions”
- In 1883, Bain was concerned that he hadn’t taken into account the number of “partially formed associations” and the number of neurons responsible for recall/learning
- By the end of his life (1903), recanted all his ideas!
 - Too complex; the brain would need too many neurons and connections

Connectionism lives on..

- The human brain is a connectionist machine
 - Bain, A. (1873). *Mind and body. The theories of their relation.* London: Henry King.
 - Ferrier, D. (1876). *The Functions of the Brain.* London: Smith, Elder and Co
- Neurons connect to other neurons. The processing/capacity of the brain is a function of these connections
- Connectionist machines emulate this structure

Connectionist Machines

- Network of processing elements
- **All world knowledge is stored in the *connections* between the elements**

Connectionist Machines

- Neural networks are *connectionist* machines
 - As opposed to Von Neumann Machines

- The machine has many non-linear processing units
 - The program is the connections between these units
 - Connections may also define memory

Recap

- Neural network based AI has taken over most AI tasks
- Neural networks originally began as computational models of the brain
 - Or more generally, models of cognition
- The earliest model of cognition was *associationism*
- The more recent model of the brain is *connectionist*
 - Neurons connect to neurons
 - The workings of the brain are encoded in these connections
- Current neural network models are *connectionist machines*

Connectionist Machines

- Network of processing elements
- All world knowledge is stored in the *connections* between the elements
- *Multiple* connectionist paradigms proposed..

Turing's Connectionist Machines

- Basic model: A-type machines
 - Networks of NAND gates
- Connectionist model: B-type machines (1948)
 - Connection between two units has a “modifier”
 - If the green line is on, the signal sails through
 - If the red is on, the output is fixed to 1
 - “Learning” – figuring out how to manipulate the coloured wires
 - Done by an A-type machine

Connectionist paradigms: PDP

Parallel Distributed Processing

- Requirements for a PDP system
(Rumelhart, Hinton, McClelland, '86; quoted from Medler, '98)
 - A set of processing units
 - A state of activation
 - An output function for each unit
 - A pattern of connectivity among units
 - A propagation rule for propagating patterns of activities through the network of connectivities
 - An activation rule for combining the inputs impinging on a unit with the current state of that unit to produce a new level of activation for the unit
 - A learning rule whereby patterns of connectivity are modified by experience
 - An environment within which the system must operate

Connectionist Systems

- Requirements for a connectionist system (Bechtel and Abrahamson, 91)
 - The connectivity of units
 - The activation function of units
 - The nature of the learning procedure that modifies the connections between units, and
 - How the network is interpreted semantically

Connectionist Machines

- Network of processing elements
 - All world knowledge is stored in the *connections* between the elements
- *But what are the individual elements?*

Modelling the brain

- What are the units?
- A neuron:

- Signals come in through the dendrites into the Soma
- A signal goes out via the axon to other neurons
 - Only one axon per neuron
- Factoid that may only interest me: Neurons do not undergo cell division
 - Neurogenesis occurs from neuronal stem cells, and is minimal after birth

McCulloch and Pitts

- The Doctor and the Hobo..
 - Warren McCulloch: Neurophysiologist
 - Walter Pitts: Homeless wannabe logician who arrived at his door

The McCulloch and Pitts model

- A mathematical model of a neuron
 - McCulloch, W.S. & Pitts, W.H. (1943). A Logical Calculus of the Ideas Immanent in Nervous Activity, Bulletin of Mathematical Biophysics, 5:115-137, 1943
 - Pitts was only 20 years old at this time

Synaptic Model

- **Excitatory synapse:** Transmits weighted input to the neuron
- **Inhibitory synapse:** Any signal from an inhibitory synapse prevents neuron from firing
 - The activity of any inhibitory synapse absolutely prevents excitation of the neuron at that time.
 - Regardless of other inputs

McCullouch and Pitts model

- Made the following assumptions
 - The activity of the neuron is an “all-or-none” process
 - A certain fixed number of synapses must be excited within the period of latent addition in order to excite a neuron at any time, and this number is independent of previous activity and position of the neuron
 - The only significant delay within the nervous system is synaptic delay
 - The activity of any inhibitory synapse absolutely prevents excitation of the neuron at that time
 - The structure of the net does not change with time

Simple "networks"
of neurons can perform
Boolean operations

Boolean Gates

$N_2(t) \leftrightarrow N_1(t-1)$
net for temporal predecessor

$N_3(t) \leftrightarrow N_1(t-1) \vee N_2(t-1)$
net for disjunction

$N_3(t) \leftrightarrow N_1(t-1) \& N_2(t-1)$
net for conjunction

$N_3(t) \leftrightarrow N_1(t-1) \& \sim N_2(t-1)$
net for conjunction and negation

Figure 1. Diagrams of McCulloch and Pitts nets. In order to send an output pulse, each neuron must receive two excitory inputs and no inhibitory inputs. Lines ending in a dot represent excitatory connections; lines ending in a hoop represent inhibitory connections.

Complex Percepts & Inhibition in action

They can even create illusions of "perception"

Figure 2. Net explaining the heat illusion. Neuron 3 (heat sensation) fires if and only if it receives two inputs, represented by the lines terminating on its body. This happens when either neuron 1 (heat reception) fires or neuron 2 (cold reception) fires once and then immediately stops firing. When neuron 2 fires twice in a row, the intermediate (unnumbered) neurons excite neuron 4 rather than neuron 3, generating a sensation of cold.

McCulloch and Pitts Model

- Could compute arbitrary Boolean propositions
 - Since any Boolean function can be emulated, any Boolean function can be composed

- Models for *memory*
 - Networks with loops can “remember”
 - We’ll see more of this later
 - Lawrence Kubie (1930): Closed loops in the central nervous system explain memory

Criticisms

- They claimed that their nets
 - should be able to compute a small class of functions
 - also if tape is provided their nets can compute a richer class of functions.
 - additionally they will be equivalent to Turing machines
 - Dubious claim that they're Turing complete
 - They didn't prove any results themselves
- Didn't provide a learning mechanism..

Donald Hebb

- “Organization of behavior”, 1949
- A learning mechanism:
 - “When an axon of cell *A* is near enough to excite a cell *B* and repeatedly or persistently takes part in firing it, some growth process or metabolic change takes place in one or both cells such that *A*'s efficiency, as one of the cells firing *B*, is increased.”
 - As *A* repeatedly excites *B*, its *ability* to excite *B* improves
 - *Neurons that fire together wire together*

Hebbian Learning

- If neuron x_i repeatedly triggers neuron y , the synaptic knob connecting x_i to y gets larger
- In a mathematical model:

$$w_i = w_i + \eta x_i y$$

- Weight of i^{th} neuron's input to output neuron y
- This simple formula is actually the basis of many learning algorithms in ML

Hebbian Learning

- **Fundamentally unstable**
 - Stronger connections will enforce themselves
 - No notion of “competition”
 - No *reduction* in weights
 - Learning is unbounded
- Number of later modifications, allowing for weight normalization, forgetting etc.
 - E.g. Generalized Hebbian learning, aka Sanger’s rule

$$w_{ij} = w_{ij} + \eta y_j \left(x_i - \sum_{k=1}^j w_{ik} y_k \right)$$

- The contribution of an input is incrementally *distributed* over multiple outputs..

A better model

- Frank Rosenblatt
 - Psychologist, Logician
 - Inventor of the solution to everything, aka the Perceptron (1958)

Rosenblatt's perceptron

- Original perceptron model
 - Groups of sensors (S) on retina combine onto cells in association area A1
 - Groups of A1 cells combine into Association cells A2
 - Signals from A2 cells combine into response cells R
 - All connections may be excitatory or inhibitory

Rosenblatt's perceptron

- Even included feedback between A and R cells
 - Ensures mutually exclusive outputs

Simplified mathematical model

- Number of inputs combine linearly
 - Threshold logic: Fire if combined input exceeds threshold

$$Y = \begin{cases} 1 & \text{if } \sum_i w_i x_i - T > 0 \\ 0 & \text{else} \end{cases}$$

His “Simple” Perceptron

- Originally assumed could represent *any* Boolean circuit and perform any logic
 - “*the embryo of an electronic computer that [the Navy] expects will be able to walk, talk, see, write, reproduce itself and be conscious of its existence,*” New York Times (8 July) 1958
 - “*Frankenstein Monster Designed by Navy That Thinks,*” Tulsa, Oklahoma Times 1958

Also provided a learning algorithm

$$\mathbf{w} = \mathbf{w} + \eta(d(\mathbf{x}) - y(\mathbf{x}))\mathbf{x}$$

Sequential Learning:

$d(x)$ is the desired output in response to input x

$y(x)$ is the actual output in response to x

- Boolean tasks
- Update the weights whenever the perceptron output is wrong
- Proved convergence for linearly separable classes

Perceptron

Values shown on edges are weights, numbers in the circles are thresholds

- Easily shown to mimic any Boolean gate
- But...

Perceptron

No solution for XOR!
Not universal!

- Minsky and Papert, 1968

A single neuron is not enough

- Individual elements are weak computational elements
 - Marvin Minsky and Seymour Papert, 1969, *Perceptrons: An Introduction to Computational Geometry*
- *Networked* elements are required

Multi-layer Perceptron!

- **XOR**

- The first layer is a “hidden” layer
- Also originally suggested by Minsky and Papert 1968

A more generic model

$$((A \& \bar{X} \& Z) | (A \& \bar{Y})) \& ((X \& Y) | \overline{(X \& Z)})$$

- A “multi-layer” perceptron
- Can compose arbitrarily complicated Boolean functions!
 - In cognitive terms: Can compute arbitrary Boolean functions over sensory input
 - More on this in the next class

Story so far

- Neural networks began as computational models of the brain
- Neural network models are *connectionist machines*
 - They comprise networks of neural units
- McCulloch and Pitts model: Neurons as Boolean threshold units
 - Models the brain as performing propositional logic
 - But no learning rule
- Hebb's learning rule: Neurons that fire together wire together
 - Unstable
- Rosenblatt's perceptron : A variant of the McCulloch and Pitts neuron with a provably convergent learning rule
 - But individual perceptrons are limited in their capacity (Minsky and Papert)
- Multi-layer perceptrons can model arbitrarily complex Boolean functions

But our brain is not Boolean

- We have real inputs
- We make non-Boolean inferences/predictions

The perceptron with *real* inputs

- $x_1 \dots x_N$ are real valued
- $w_1 \dots w_N$ are real valued
- Unit “fires” if weighted input exceeds a threshold

The perceptron with *real* inputs and a *real output*

- $x_1 \dots x_N$ are real valued
- $w_1 \dots w_N$ are real valued
- The output y can also be real valued
 - Sometimes viewed as the “probability” of firing

The “real” valued perceptron

- Any real-valued “activation” function may operate on the weighted-sum input
 - We will see several later
 - Output will be real valued
- The perceptron maps real-valued inputs to real-valued outputs
- *Is useful to continue assuming Boolean outputs though, for interpretation*

A Perceptron on Reals

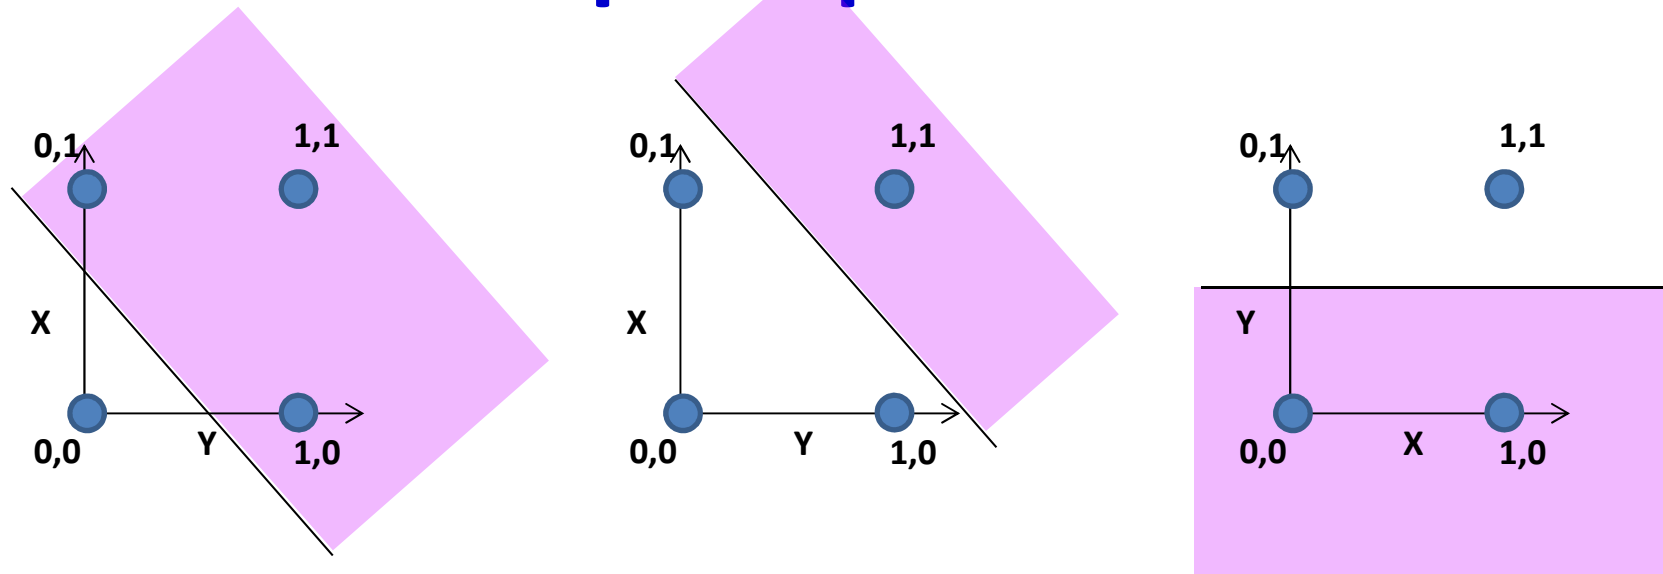

$$y = \begin{cases} 1 & \text{if } \sum_i w_i x_i \geq T \\ 0 & \text{else} \end{cases}$$

- A perceptron operates on *real*-valued vectors

– This is a *linear classifier*

Boolean functions with a real perceptron

- Boolean perceptrons are also linear classifiers
 - Purple regions have output 1 in the figures
 - What are these functions
 - Why can we not compose an XOR?

Composing complicated “decision” boundaries

Can now be composed into “networks” to compute arbitrary classification “boundaries”

- Build a network of units with a single output that fires if the input is in the coloured area

Booleans over the reals

- The network must fire if the input is in the coloured area

Booleans over the reals

- The network must fire if the input is in the coloured area

Booleans over the reals

- The network must fire if the input is in the coloured area

Booleans over the reals

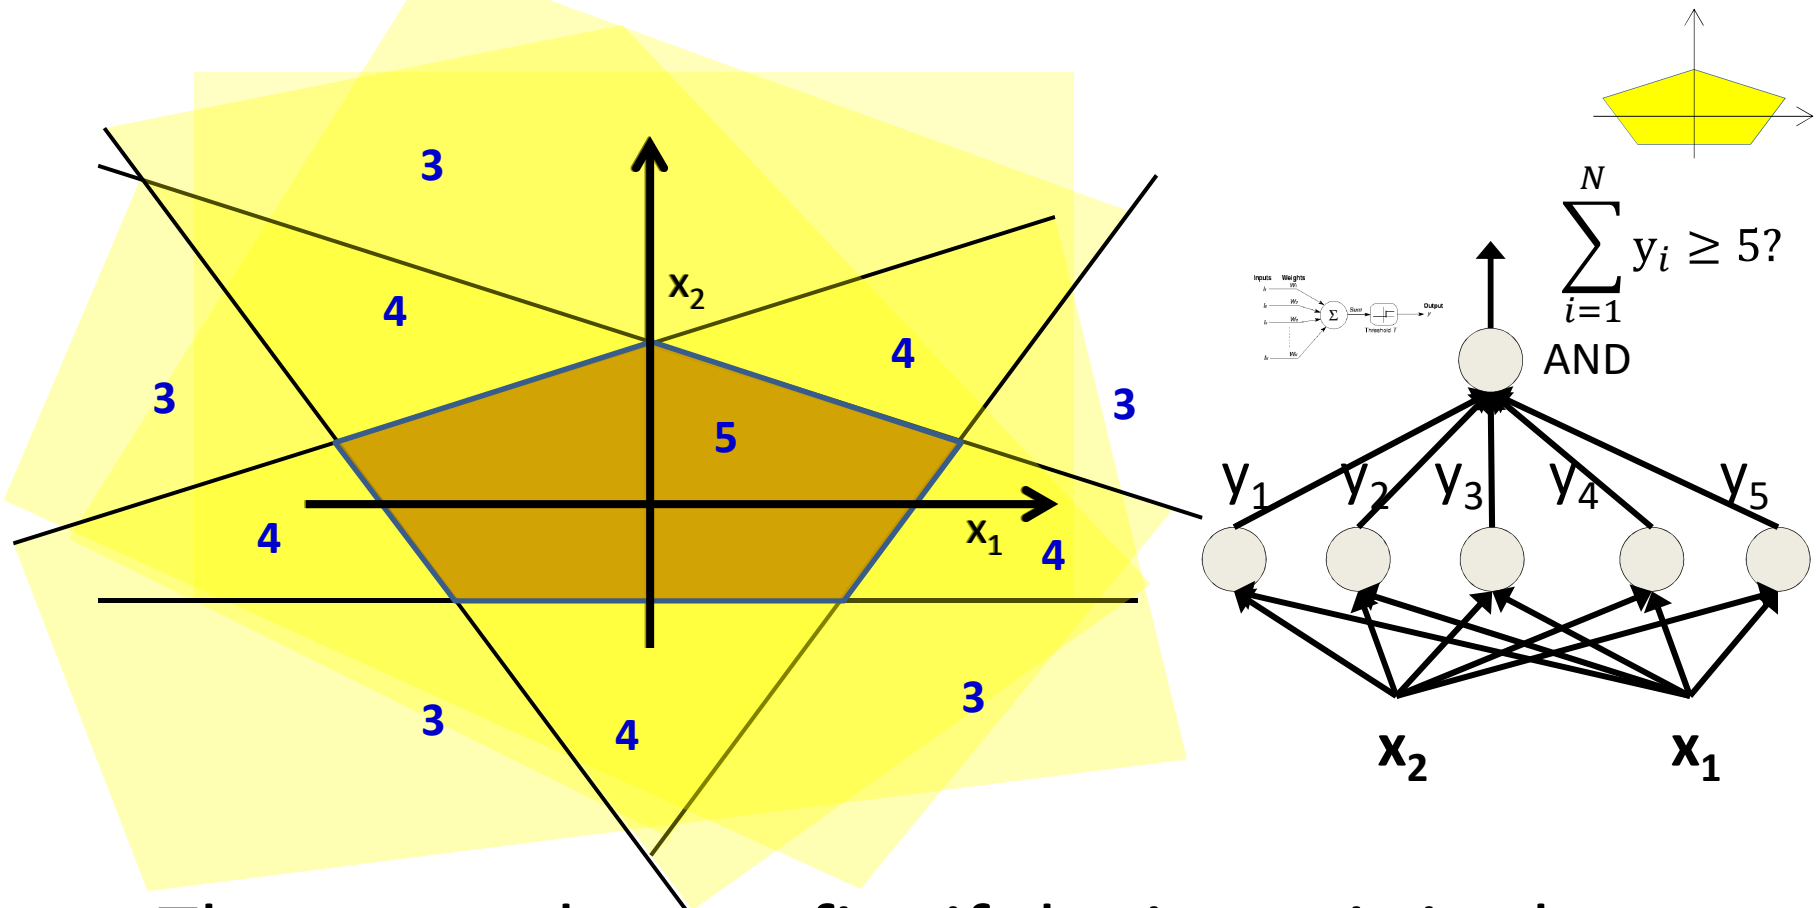

- The network must fire if the input is in the coloured area

Booleans over the reals

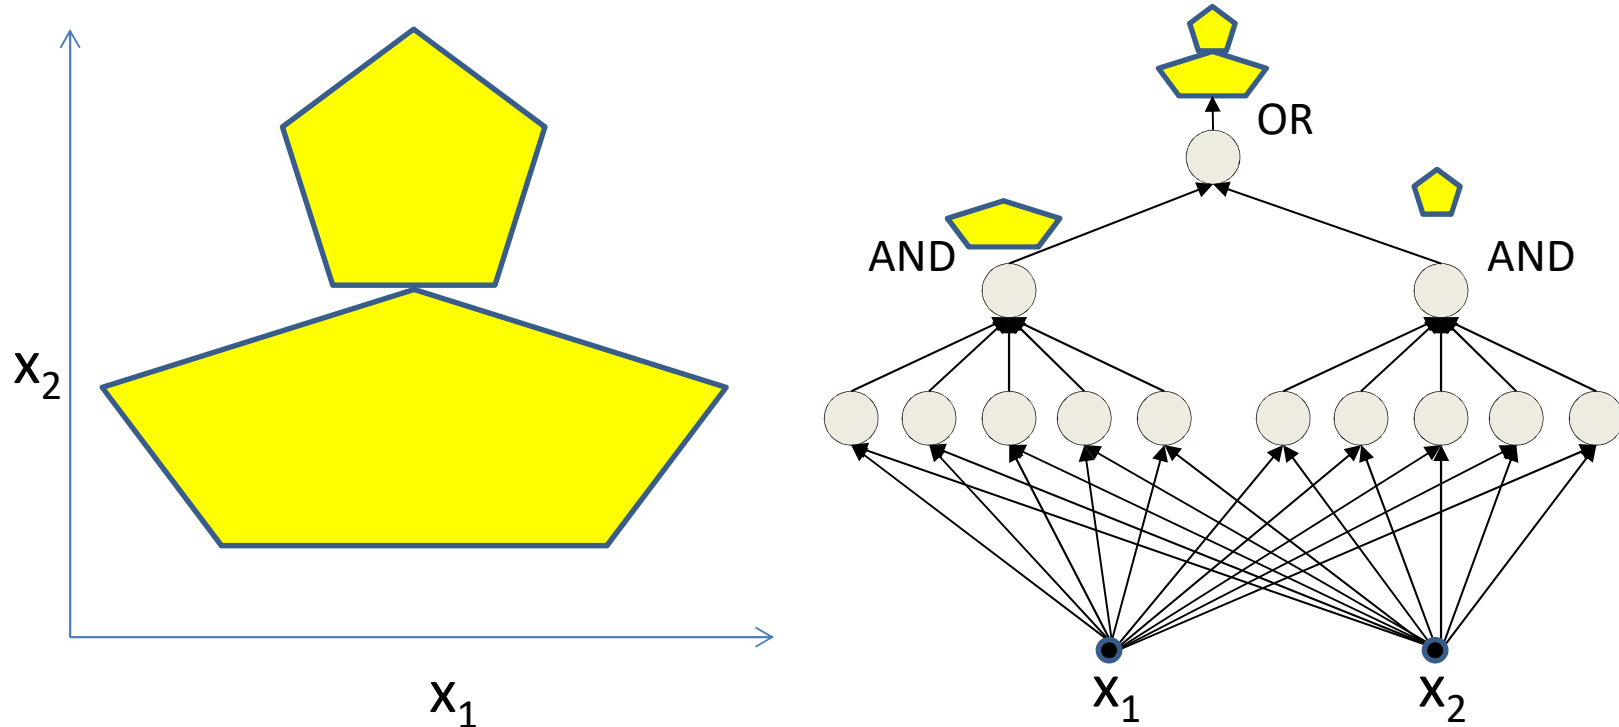

- The network must fire if the input is in the coloured area

Booleans over the reals

- The network must fire if the input is in the coloured area

More complex decision boundaries

- Network to fire if the input is in the yellow area
 - “OR” two polygons
 - A third layer is required

Complex decision boundaries

- Can compose very complex decision boundaries
 - How complex exactly? More on this in the next class

Complex decision boundaries

- Classification problems: finding decision boundaries in high-dimensional space
 - Can be performed by an MLP
- MLPs can *classify* real-valued inputs

Story so far

- **MLPs are connectionist computational models**
 - Individual perceptrons are computational equivalent of neurons
 - The MLP is a layered composition of many perceptrons
- **MLPs can model Boolean functions**
 - Individual perceptrons can act as Boolean gates
 - Networks of perceptrons are Boolean functions
- **MLPs are Boolean *machines***
 - They represent Boolean functions over linear boundaries
 - They can represent arbitrary decision boundaries
 - They can be used to *classify* data

But what about continuous valued *outputs?*

- Inputs may be real valued
- Can outputs be continuous-valued too?

MLP as a continuous-valued regression

- A simple 3-unit MLP with a “summing” output unit can generate a “square pulse” over an input
 - Output is 1 only if the input lies between T_1 and T_2
 - T_1 and T_2 can be arbitrarily specified

MLP as a continuous-valued regression

- A simple 3-unit MLP can generate a “square pulse” over an input
- **An MLP with many units can model an arbitrary function over an input**
 - To arbitrary precision
 - Simply make the individual pulses narrower
- This generalizes to functions of any number of inputs (next class)

Story so far

- **Multi-layer perceptrons are connectionist computational models**
- **MLPs are *classification engines***
 - They can identify classes in the data
 - Individual perceptrons are feature detectors
 - The network will fire if the combination of the detected basic features matches an “acceptable” pattern for a desired class of signal
- **MLP can also model continuous valued functions**

So what does the perceptron really model?

- Is there a “semantic” interpretation?
 - Cognitive version: Is there an interpretation beyond the simple characterization as Boolean functions over sensory inputs?

Lets look at the weights

$$y = \begin{cases} 1 & \text{if } \sum_i w_i x_i \geq T \\ 0 & \text{else} \end{cases}$$

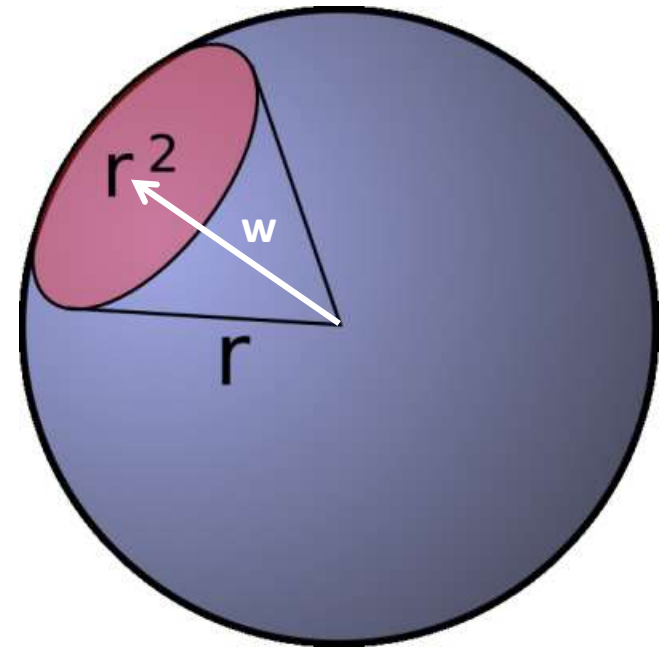

$$y = \begin{cases} 1 & \text{if } \mathbf{x}^T \mathbf{w} \geq T \\ 0 & \text{else} \end{cases}$$

- What do the *weights* tell us?
 - The neuron fires if the inner product between the weights and the inputs exceeds a threshold

The weight as a “template”

$$X^T W > T$$
$$\cos \theta > \frac{T}{|X|}$$
$$\theta < \cos^{-1} \left(\frac{T}{|X|} \right)$$

- The perceptron fires if the input is within a specified angle of the weight
- Neuron fires if the input vector is close enough to the weight vector.
 - If the input pattern matches the weight pattern closely enough

The weight as a template

Correlation = 0.57

Correlation = 0.82

$$y = \begin{cases} 1 & \text{if } \sum_i w_i x_i \geq T \\ 0 & \text{else} \end{cases}$$

- If the *correlation* between the weight pattern and the inputs exceeds a threshold, fire
- The perceptron is a *correlation filter*!

The MLP as a Boolean function over feature detectors

- The input layer comprises “feature detectors”
 - Detect if certain patterns have occurred in the input
- The network is a Boolean function over the feature detectors
- I.e. it is important for the *first* layer to capture relevant patterns

The MLP as a cascade of feature detectors

- The network is a cascade of feature detectors
 - Higher level neurons compose complex templates from features represented by lower-level neurons

Story so far

- **Multi-layer perceptrons are connectionist computational models**
- **MLPs are Boolean *machines***
 - They can model Boolean functions
 - They can represent arbitrary decision boundaries over real inputs
- **MLPs can approximate continuous valued functions**
- **Perceptrons are *correlation filters***
 - They detect patterns in the input

Other things MLPs can do

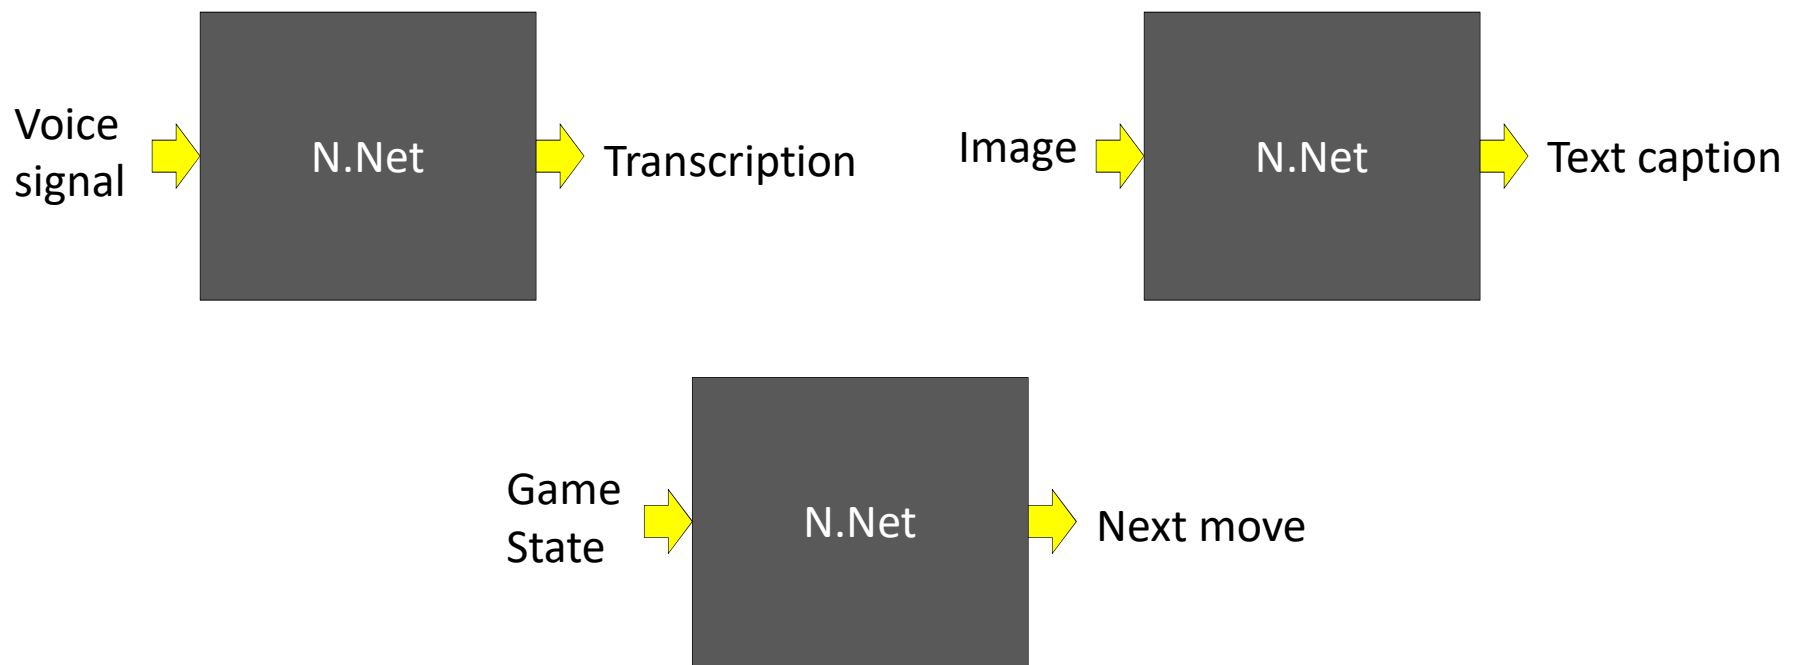

- Model memory
 - Loopy networks can “remember” patterns
 - Proposed by Lawrence Kubie in 1930, as a model for memory in the CNS
- Represent probability distributions
 - Over integer, real and complex-valued domains
 - MLPs can model both *a posteriori* and *a priori* distributions of data
 - A posteriori conditioned on other variables
- They can rub their stomachs and pat their heads at the same time..

NNets in AI

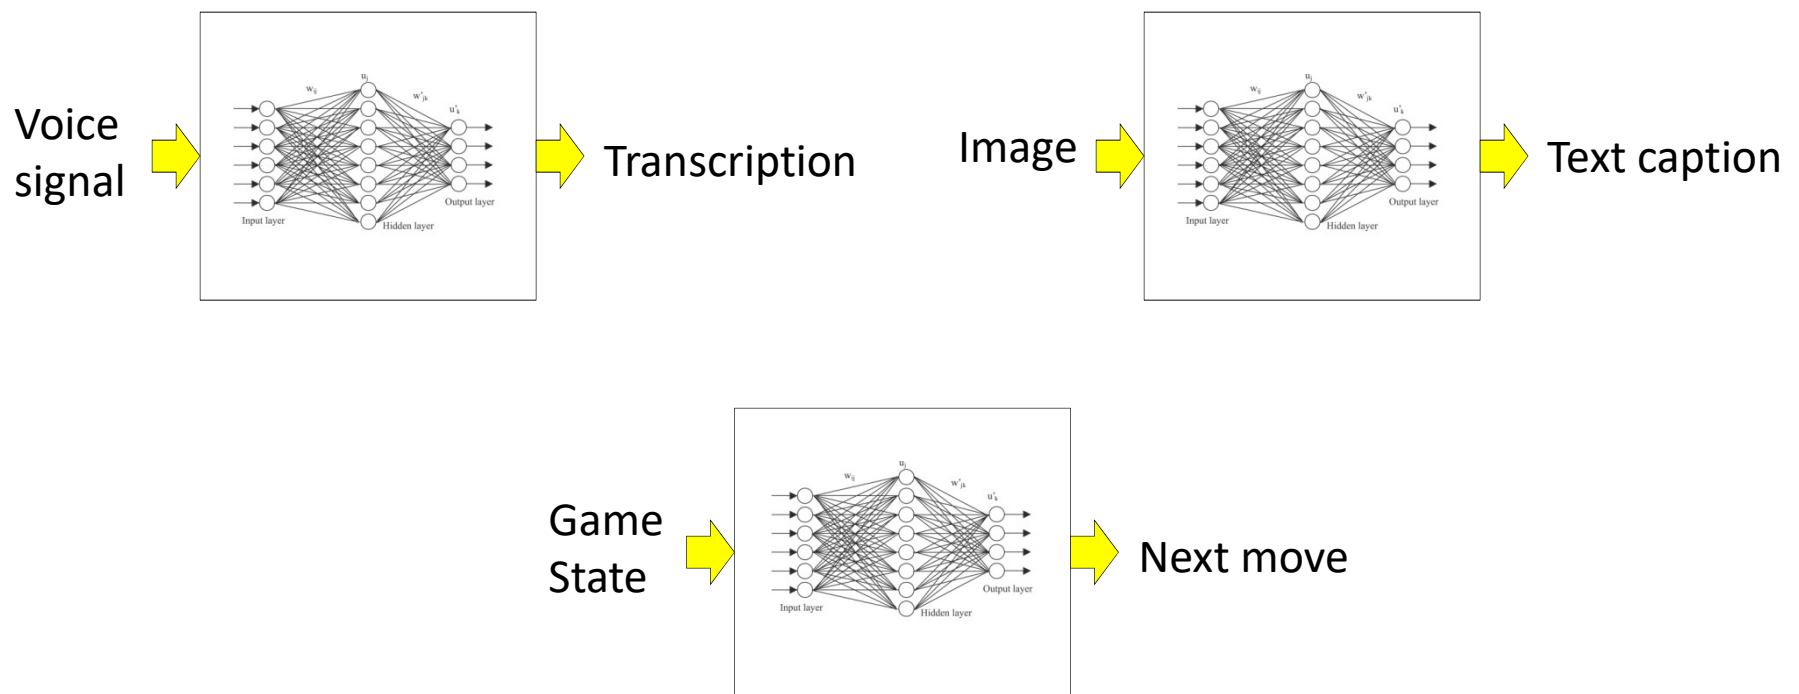

- The network is a function
 - Given an input, it computes the function layer wise to predict an output
 - More generally, given one or more inputs, predicts one or more outputs

These tasks are *functions*

- Each of these boxes is actually a function
 - E.g $f: \text{Image} \rightarrow \text{Caption}$

These tasks are *functions*

- Each box is actually a function
 - E.g. f : Image \rightarrow Caption
 - It can be approximated by a neural network

The network as a function

- Inputs are numeric vectors
 - Numeric representation of input, e.g. audio, image, game state, etc.
- Outputs are numeric scalars or vectors
 - Numeric “encoding” of output from which actual output can be derived
 - E.g. a score, which can be compared to a threshold to decide if the input is a face or not
 - Output may be multi-dimensional, if task requires it

Story so far

- **Multi-layer perceptrons are connectionist computational models**
- **MLPs are *classification engines***
- **MLP can also model continuous valued functions**
- **Interesting AI tasks are functions that can be modelled by the network**
