Fundamentals of Linear
Algebra, Part II

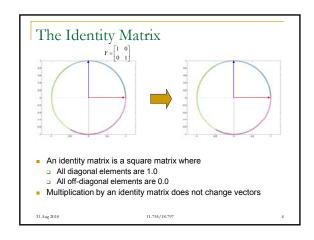

Class 2. 31 August 2009

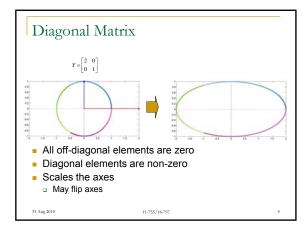

Instructor: Bhiksha Raj

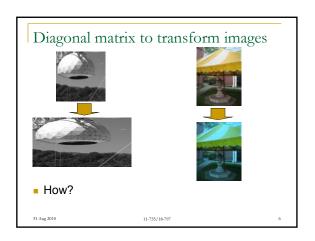

Administrivia Registration: Anyone on waitlist still? We have a second TA Sohail Bahmani sbahmani@andrew.cmu.edu Homework: Slightly delayed Linear algebra Adding some fun new problems. Use the discussion lists on blackboard.andrew.cmu.edu Blackboard – if you are not registered on blackboard please register

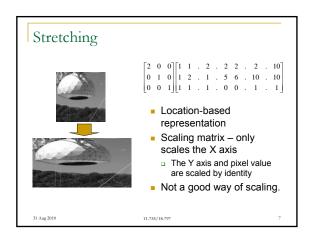

Overview

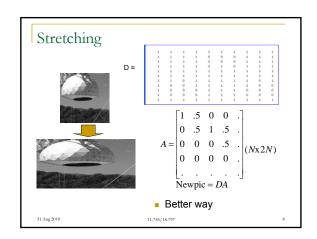

• Vectors and matrices
• Basic vector/matrix operations
• Vector products
• Matrix products
• Various matrix types
• Matrix inversion
• Matrix interpretation
• Eigenanalysis
• Singular value decomposition

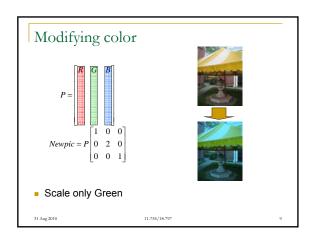

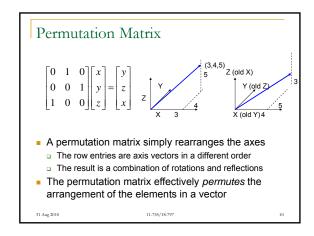

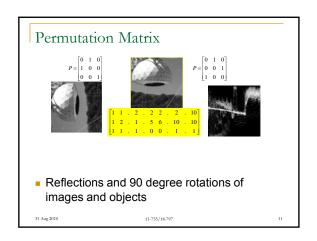

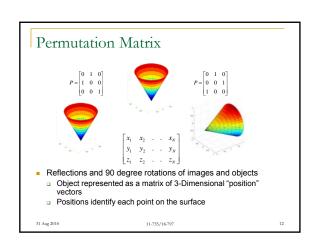

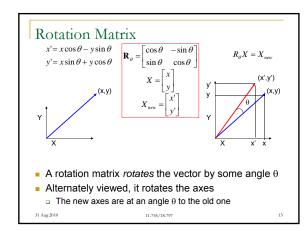

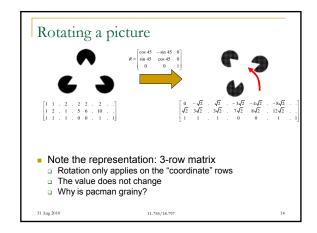

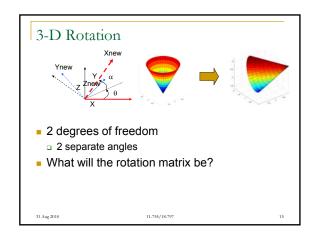

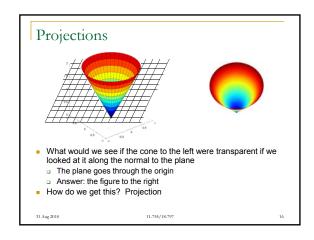

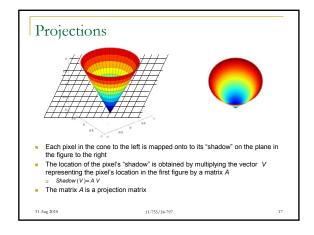

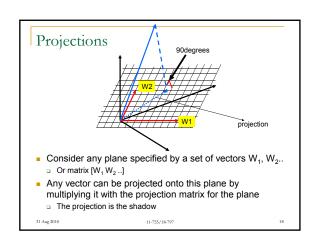

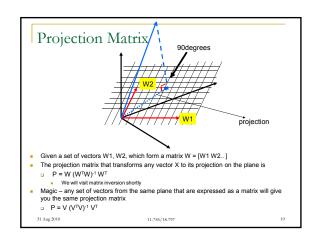

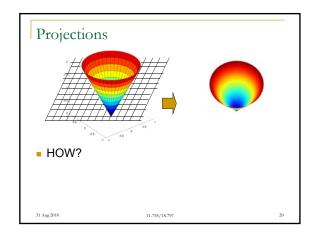

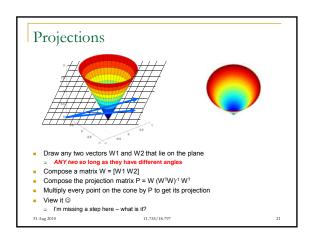

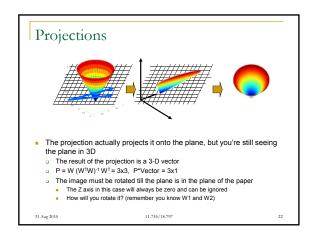

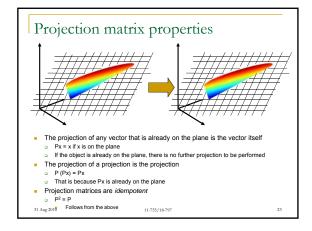

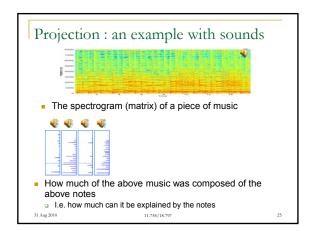

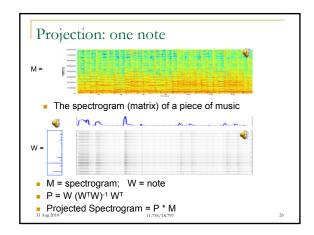

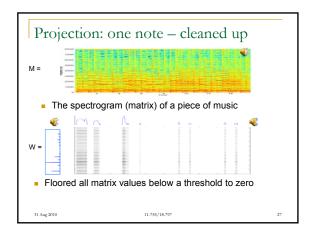

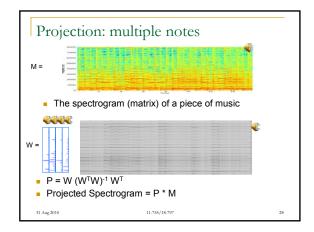

Projections: A more physical meaning Let W₁, W₂ .. W_k be "bases" We want to explain our data in terms of these "bases" We often cannot do so But we can explain a significant portion of it The portion of the data that can be expressed in terms of our vectors W₁, W₂, .. W_k, is the projection of the data on the W₁ .. W_k (hyper) plane In our previous example, the "data" were all the points on a cone The interpretation for volumetric data is obvious

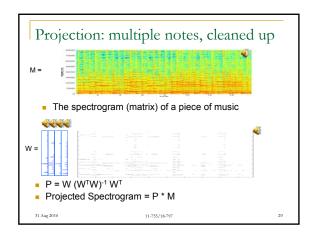

11-755/18-797

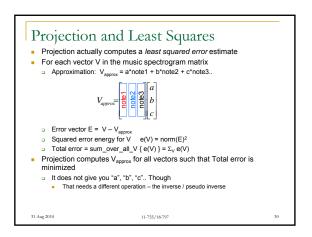

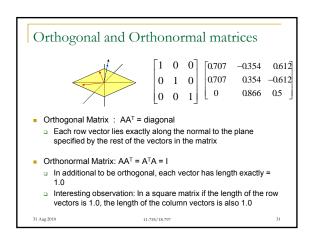

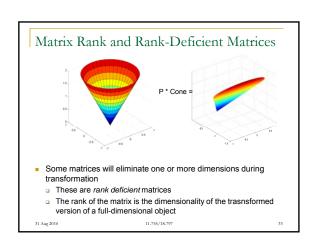

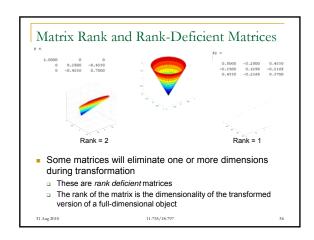

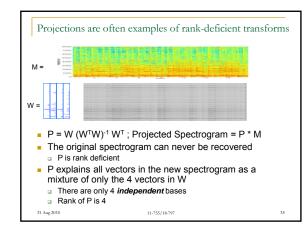

Orthogonal and Orthonormal Matrices

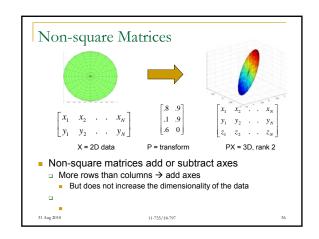

- Orthonormal matrices will retain the relative angles between transformed vectors
- Essentially, they are combinations of rotations, reflections and permutations
- Rotation matrices and permutation matrices are all orthonormal matrices
- The vectors in an orthonormal matrix are at 90degrees to one another.
- Orthogonal matrices are like Orthonormal matrices with stretching
 - □ The product of a diagonal matrix and an orthonormal matrix

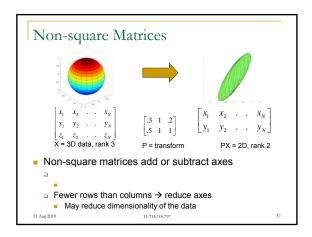

Aug 2010 11-755/18-797 32

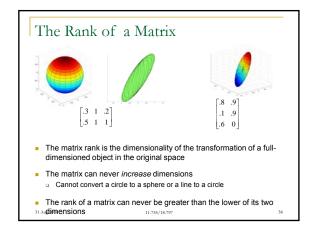

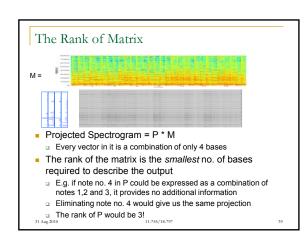

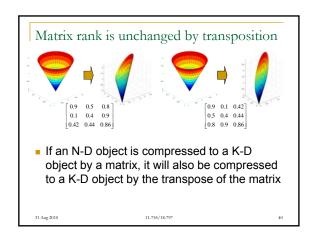

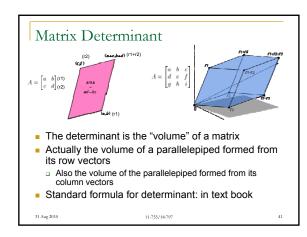

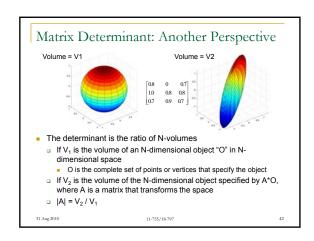

Matrix Determinants

- Matrix determinants are only defined for square matrices
 - They characterize volumes in linearly transformed space of the same dimensionality as the vectors
- Rank deficient matrices have determinant 0
 - Since they compress full-volumed N-D objects into zero-volume N-D objects
 - E.g. a 3-D sphere into a 2-D ellipse: The ellipse has 0 volume (although it does have area)
- Conversely, all matrices of determinant 0 are rank deficient
 - Since they compress full-volumed N-D objects into zero-volume objects

31 Aug 2010 11-755/18-797

Multiplication properties

- Properties of vector/matrix products
 - Associative

$$\mathbf{A} \cdot (\mathbf{B} \cdot \mathbf{C}) = (\mathbf{A} \cdot \mathbf{B}) \cdot \mathbf{C}$$

Distributive

$$\mathbf{A} \cdot (\mathbf{B} + \mathbf{C}) = \mathbf{A} \cdot \mathbf{B} + \mathbf{A} \cdot \mathbf{C}$$

■ NOT commutative!!!

$$A\cdot B\neq B\cdot A$$

- left multiplications ≠ right multiplications
- Transposition

$$(\mathbf{A} \cdot \mathbf{B})^T = \mathbf{B}^T \cdot \mathbf{A}^T$$

2010 1

Determinant properties

- Associative for square matrices $|\mathbf{A}\cdot\mathbf{B}\cdot\mathbf{C}| = |\mathbf{A}|\cdot|\mathbf{B}|\cdot|\mathbf{C}|$
 - Scaling volume sequentially by several matrices is equal to scaling once by the product of the matrices
- Volume of sum != sum of Volumes $\left| (B+C) \right|
 eq \left| B \right| + \left| C \right|$
 - The volume of the parallelepiped formed by row vectors of the sum of two matrices is not the sum of the volumes of the parallelepipeds formed by the original matrices
- Commutative for square matrices!!!

31 Aug 2010

$$|\mathbf{A} \cdot \mathbf{B}| = |\mathbf{B} \cdot \mathbf{A}| = |\mathbf{A}| \cdot |\mathbf{B}|$$

□ The order in which you scale the volume of an object is irrelevant

31 Aug 2010 11-755/18-797 4

Matrix Inversion

- A matrix transforms an N-D object to a different N-D object

- What transforms the new object back to the original?

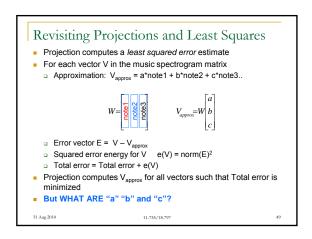

- The inverse transformation

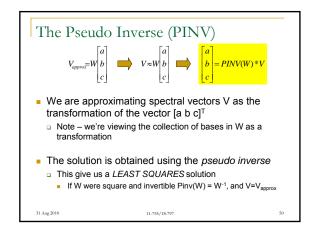

- The inverse transformation is called the matrix inverse

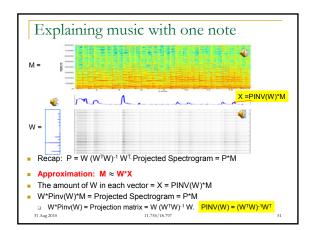

Matrix Inversion
To the product of a matrix and its inverse is the identity matrix
Transforming an object, and then inverse transforming it gives us back the original object

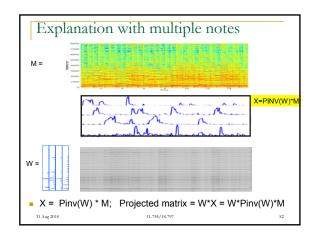

11-755/18-797

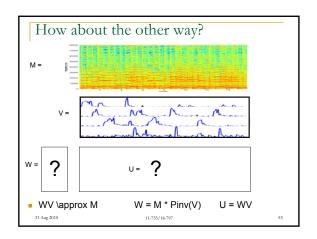

31 Aug 2010

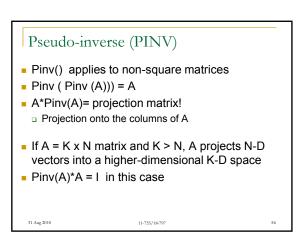

Matrix inversion (division)

- The inverse of matrix multiplication
- Not element-wise division!!
- Provides a way to "undo" a linear transformation
 - Inverse of the unit matrix is itself
- Inverse of a diagonal is diagonal
- Inverse of a rotation is a (counter)rotation (its transpose!)
- Inverse of a rank deficient matrix does not exist! But pseudoinverse exists
- Pay attention to multiplication side!

$$\mathbf{A} \cdot \mathbf{B} = \mathbf{C}, \ \mathbf{A} = \mathbf{C} \cdot \mathbf{B}^{-1}, \ \mathbf{B} = \mathbf{A}^{-1} \cdot \mathbf{C}$$

- Matrix inverses defined for square matrices only
- If matrix not square use a matrix pseudoinverse:

$$\mathbf{A} \cdot \mathbf{B} = \mathbf{C}, \ \mathbf{A} = \mathbf{C} \cdot \mathbf{B}^{+}, \ \mathbf{B} = \mathbf{A}^{+} \cdot \mathbf{C}$$

• MATLAB syntax: inv(a), pinv(a)

31 Aug 2010

What is the Matrix ? MATRIX

- Duality in terms of the matrix identity
 - Can be a container of data
 - An image, a set of vectors, a table, etc ...
 - □ Can be a <u>linear</u> transformation
 - A process by which to transform data in another matrix
- We'll usually start with the first definition and then apply the second one on it
- Very frequent operation
- Room reverberations, mirror reflections, etc ...
- Most of signal processing and machine learning are matrix operations!

Eigenanalysis

- If something can go through a process mostly unscathed in character it is an eigen-something
 - Sound example:
- .
- **.**
- A vector that can undergo a matrix multiplication and keep pointing the same way is an eigenvector
 - Its length can change though
- How much its length changes is expressed by its corresponding eigenvalue
- Each eigenvector of a matrix has its eigenvalue
- Finding these "eigenthings" is called eigenanalysis

31 Aug 2010

11-755/18-797

EigenVectors and EigenValues

Black are eigen vectors

- Vectors that do not change angle upon transformation
 - They may change length

$MV = \lambda V$

- V = eigen vector
- λ = eigen value
- Matlab: [V, L] = eig(M)
- L is a diagonal matrix whose entries are the eigen values
- V is a maxtrix whose columns are the eigen vectors

Eigen vector example

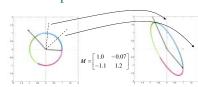

31 Aug 2010

11-755/18-797

Matrix multiplication revisited

- Matrix transformation "transforms" the space
 - Warps the paper so that the normals to the two vectors now lie along the axes

11-755/18-797

10

A stretching operation

- Draw two lines
- Stretch / shrink the paper along these lines by factors λ_{1} and λ_{2}
 - □ The factors could be negative implies flipping the paper
- The result is a transformation of the space

....

- Draw two lines
- Stretch / shrink the paper along these lines by factors λ_1 and λ_2
- □ The factors could be negative implies flipping the paper
- The result is a transformation of the space

11.755/18.707

Physical interpretation of eigen vector

- The result of the stretching is exactly the same as transformation by a matrix
- The axes of stretching/shrinking are the eigenvectors
 - The degree of stretching/shrinking are the corresponding eigenvalues
- The EigenVectors and EigenValues convey all the information about the matrix

31 Aug 2010

11-755/18-797

Physical interpretation of eigen vector

$$V = \begin{bmatrix} V_1 & V_2 \\ \lambda_1 & 0 \end{bmatrix}$$
$$L = \begin{bmatrix} \lambda_1 & 0 \\ 0 & \lambda_2 \end{bmatrix}$$
$$M = VLV^{-1}$$

- The result of the stretching is exactly the same as transformation by a matrix
- The axes of stretching/shrinking are the eigenvectors
- The degree of stretching/shrinking are the corresponding eigenvalues
- The EigenVectors and EigenValues convey all the information about the matrix

31 Aug 2010

11-755/18-797

Eigen Analysis

- Not all square matrices have nice eigen values and vectors
 - E.g. consider a rotation matrix

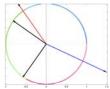

- This rotates every vector in the plane
- No vector that remains unchanged
- In these cases the Eigen vectors and values are complex
- Some matrices are special however...

l Aug 2010

Symmetric Matrices

 $\begin{bmatrix} 1.5 & -0.7 \\ -0.7 & 1 \end{bmatrix}$

- Matrices that do not change on transposition
- Row and column vectors are identical
- Symmetric matrix: Eigen vectors and Eigen values are always real
- Eigen vectors are always orthogonal
- At 90 degrees to one another
