

**MLSP**  
Machine Learning for Signal Processing

## Machine Learning for Signal Processing

### Lecture 1: Signal Representations

Class 1. 29 August 2013

Instructor: Bhiksha Raj

29 Aug 2013 11-755/18-797 1

**MLSP**  
Machine Learning for Signal Processing

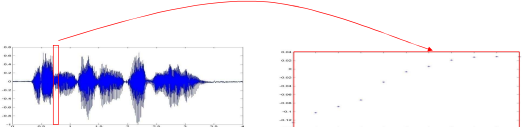

## What is a signal

- A mechanism for conveying information
  - Semaphores, gestures, traffic lights..
- Electrical engineering: currents, voltages
- Digital signals: Ordered collections of numbers that convey information
  - from a source to a destination
  - about a real world phenomenon
    - Sounds, images

29 Aug 2013 11-755/18-797 2

**MLSP**  
Machine Learning for Signal Processing

## Signal Examples: Audio

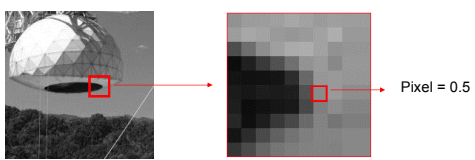

- A sequence of numbers
  - $[n_1 \ n_2 \ n_3 \ n_4 \ \dots]$
  - The order in which the numbers occur is important
    - Ordered
      - In this case, a *time series*
  - Represent a perceivable sound

29 Aug 2013 11-755/18-797 3

**MLSP**  
Machine Learning for Signal Processing

## Example: Images

- A rectangular arrangement (matrix) of numbers
  - Or sets of numbers (for color images)
- Each pixel represents a visual representation of one of these numbers
  - 0 is minimum / black, 1 is maximum / white
  - Position / order is important

29 Aug 2013 11-755/18-797 4

**MLSP**  
Machine Learning for Signal Processing

## What is Signal Processing

- Acquisition, Analysis, Interpretation, and Manipulation of signals.
  - Acquisition: Sampling, sensing
  - Decomposition: Fourier transforms, wavelet transforms, dictionary-based representations
  - Denoising signals
  - Coding: GSM, Jpeg, Mpeg, Ogg Vorbis
  - Detection: Radars, Sonars
  - Pattern matching: Biometrics, Iris recognition, finger print recognition
  - Etc.

29 Aug 2013 11-755/18-797 5

**MLSP**  
Machine Learning for Signal Processing

## What is Machine Learning

- The science that deals with the development of algorithms that can learn from data
  - Learning patterns in data
    - Automatic categorization of text into categories; Market basket analysis
  - Learning to classify between different kinds of data
    - Spam filtering: Valid email or junk?
  - Learning to predict data
    - Weather prediction, movie recommendation
- Statistical analysis and pattern recognition when performed by a computer scientist..

29 Aug 2013 11-755/18-797 6

## MLSP

- Application of Machine Learning techniques to the analysis of signals
  - Such as audio, images, video, etc.
- *Data driven* analysis of signals
  - *Characterizing* signals
    - What are they composed of?
  - *Detecting* signals
    - Radars. Face detection. Speaker verification
  - *Recognize* signals
    - Face recognition. Speech recognition.
  - *Predict* signals
  - Etc..

29 Aug 2013

11-755/18-797

7

## In this course

- Jetting through fundamentals:
  - Linear Algebra, Signal Processing, Probability
- Machine learning concepts
  - Methods of modelling, estimation, classification, prediction
- Applications:
  - Sounds:
    - Characterizing sounds, Denoising speech, Synthesizing speech, Separating sounds in mixtures, Music retrieval
  - Images:
    - Characterization, Object detection and recognition, Biometrics
  - Other forms of data
  - Representation
  - Sensing and recovery.
- Topics covered are representative
- Actual list to be covered may change, depending on how the course progresses

29 Aug 2013

11-755/18-797

8

## Recommended Background

- DSP
  - Fourier transforms, linear systems, basic statistical signal processing
- Linear Algebra
  - Definitions, vectors, matrices, operations, properties
- Probability
  - Basics: what is a random variable, probability distributions, functions of a random variable
- Machine learning
  - Learning, modelling and classification techniques

29 Aug 2013

11-755/18-797

9

## Guest Lectures

- Fernando de la Torre
  - Component Analysis
- Roger Dannenberg
  - Music Understanding
- Aswin Sankarnarayanan
  - Compressive Sensing
- Marios Savvides
  - Visual biometrics
- Ajay Diwakaran
  - Multimedia analysis
- Yaser Sheikh
  - Structure from motion

29 Aug 2013

11-755/18-797

10

## Travels..

- I will be travelling in Oct/Nov:
  - 28 Oct – 1 Nov: Lisbon
  - 2 Nov – 6 Nov: Berlin
- We will have four guest lectures in this period

29 Aug 2013

11-755/18-797

11

## Schedule of Other Lectures

- Tentative Schedule on Website
- <http://mlsp.cs.cmu.edu/courses/fall2013>

29 Aug 2013

11-755/18-797

12

## Grading

- Homework assignments : 50%
  - Mini projects
  - Will be assigned during course
  - Minimum 3, Maximum 4
  - You *will not catch up* if you slack on any homework
    - Those who didn't slack will also do the next homework
- Final project: 50%
  - Will be assigned early in course
  - Dec 5: Poster presentation for all projects, with demos (if possible)
    - Partially graded by visitors to the poster

29 Aug 2013

11-755/18-797

13

## Projects

- Previous projects (partially) accessible from web pages for prior years
- Expect significant supervision
- Outcomes from previous years
  - 10+ papers
  - 2 best paper awards
  - 1 PhD thesis
  - Several masters' theses

29 Aug 2013

11-755/18-797

14

## Instructor and TA

- Instructor: Prof. Bhiksha Raj
  - Room 6705 Hillman Building
  - [bhiksha@cs.cmu.edu](mailto:bhiksha@cs.cmu.edu)
  - 412 268 9826

- TAs:
  - James Ding
    - [dingyingjian@gmail.com](mailto:dingyingjian@gmail.com)
  - Varun Gupta
    - [vgupta1@andrew.cmu.edu](mailto:vgupta1@andrew.cmu.edu)

- Office Hours:
  - Bhiksha Raj: Wed 3:30-4.30
  - TA: TBD

29 Aug 2013

11-755/18-797

15

## Additional Administrivia

- Website:
  - <http://mlsp.cs.cmu.edu/courses/fall2013/>
  - Lecture material will be posted on the day of each class on the website
  - Reading material and pointers to additional information will be on the website
- Mailing list: Use blackboard
  - All notices will be posted there

29 Aug 2013

11-755/18-797

16

## Additional Administrivia

- How many on waitlist?

29 Aug 2013

11-755/18-797

17

## Representing Data

- Audio
- Images
  - Video
- Other types of signals
  - In a manner similar to one of the above

29 Aug 2013

11-755/18-797

18

### What is an audio signal

- A typical digital audio signal
  - It's a sequence of points

29 Aug 2013 11-755/18-797 19

### Where do these numbers come from?

- Any sound is a pressure wave: alternating highs and lows of air pressure moving through the air
- When we speak, we produce these pressure waves
  - Essentially by producing puff after puff of air
  - Any sound producing mechanism actually produces pressure waves
- These pressure waves move the eardrum
  - Highs push it in, lows suck it out
  - We sense these motions of our eardrum as "sound"

29 Aug 2013 11-755/18-797 20

### SOUND PERCEPTION

29 Aug 2013 11-755/18-797 21

### Storing pressure waves on a computer

- The pressure wave moves a diaphragm
  - On the microphone
- The motion of the diaphragm is converted to continuous variations of an electrical signal
  - Many ways to do this
- A "sampler" samples the continuous signal at regular intervals of time and stores the numbers

29 Aug 2013 11-755/18-797 22

### Are these numbers sound?

- How do we even know that the numbers we store on the computer have anything to do with the recorded sound really?
  - Recreate the sense of sound
- The numbers are used to control the levels of an electrical signal

29 Aug 2013 11-755/18-797 23

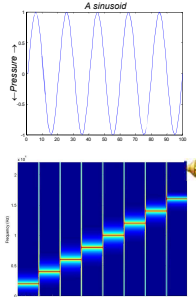

### Are these numbers sound?

- How do we even know that the numbers we store on the computer have anything to do with the recorded sound really?
  - Recreate the sense of sound
- The numbers are used to control the levels of an electrical signal
- The electrical signal moves a diaphragm back and forth to produce a pressure wave
  - That we sense as sound

29 Aug 2013 11-755/18-797 24

## How many samples a second

- Convenient to think of sound in terms of sinusoids with frequency
- Sounds may be modelled as the sum of many sinusoids of different frequencies
  - Frequency is a physically motivated unit
  - Each hair cell in our inner ear is tuned to specific frequency
- Any sound has many frequency components
  - We can hear frequencies up to 16000Hz
    - Frequency components above 16000Hz can be heard by children and some young adults
    - Nearly nobody can hear over 20000Hz.

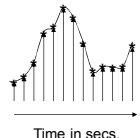

MLSP

29 Aug 2013 11-755/18-797 25

## Signal representation - Sampling

- Sampling frequency (or sampling rate)** refers to the number of samples taken a second
- Sampling rate is measured in Hz
  - We need a sample rate twice as high as the highest frequency we want to represent (Nyquist freq)
- For our ears this means a sample rate of at least 40kHz
  - Because we hear up to 20kHz

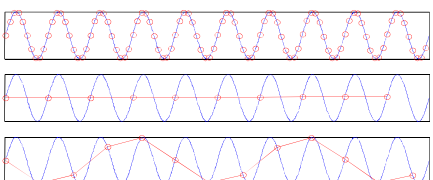

MLSP

29 Aug 2013 11-755/18-797 26

## Aliasing

- Low sample rates result in *aliasing*
  - High frequencies are misrepresented
  - Frequency  $f_1$  will become (sample rate -  $f_1$ )
  - In video also when you see wheels go backwards

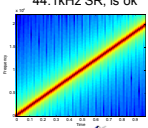

MLSP

29 Aug 2013 11-755/18-797 27

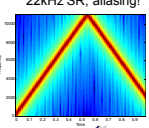

## Aliasing examples

Sinusoid sweeping from 0Hz to 20kHz

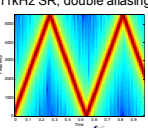

44.1kHz SR, is ok

22kHz SR, aliasing!

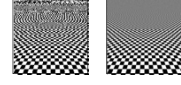

11kHz SR, double aliasing!

On real sounds

On images

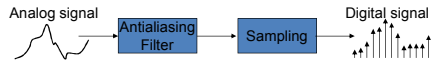

On video

MLSP

29 Aug 2013 11-755/18-797 28

## Avoiding Aliasing

- Sound naturally has all perceivable frequencies
  - And then some
  - Cannot control the rate of variation of pressure waves in nature
- Sampling at *any* rate will result in aliasing
- Solution: *Filter the electrical signal* before sampling it
  - Cut off all frequencies above sampling.frequency/2
  - E.g., to sample at 44.1Khz, filter the signal to eliminate all frequencies above 22050 Hz

MLSP

29 Aug 2013 11-755/18-797 29

## Typical Sampling Rates

- Common sample rates
  - For speech 8kHz to 16kHz
  - For music 32kHz to 44.1kHz
  - Pro-equipment 96kHz

MLSP

29 Aug 2013 11-755/18-797 30

### Storing numbers on the Computer

- Sound is the outcome of a continuous range of variations
  - The pressure wave can take any value (within limits)
  - The diaphragm can also move continuously
  - The electrical signal from the diaphragm has continuous variations
- A computer has finite resolution
  - Numbers can only be stored to finite resolution
  - E.g. a 16-bit number can store only 65536 values, while a 4-bit number can store only 16 values
  - To store the sound wave on the computer, the continuous variation must be “mapped” on to the discrete set of numbers we can store

29 Aug 2013 11-755/18-797 31

### Mapping signals into bits

- Example of 1-bit sampling table

Signal Value	Bit sequence	Mapped to
$S > 2.5v$	1	$1 * \text{const}$
$S \leq 2.5v$	0	0

29 Aug 2013 11-755/18-797 32

### Mapping signals into bits

- Example of 2-bit sampling table

Signal Value	Bit sequence	Mapped to
$S \geq 3.75v$	11	$3 * \text{const}$
$3.75v > S \geq 2.5v$	10	$2 * \text{const}$
$2.5v > S \geq 1.25v$	01	$1 * \text{const}$
$1.25v > S \geq 0v$	0	0

29 Aug 2013 11-755/18-797 33

### Storing the signal on a computer

- The original signal
- 8 bit quantization
- 3 bit quantization
- 2 bit quantization
- 1 bit quantization

29 Aug 2013 11-755/18-797 34

### Tom Sullivan Says his Name

- 16 bit sampling
- 5 bit sampling
- 4 bit sampling
- 3 bit sampling
- 1 bit sampling

29 Aug 2013 11-755/18-797 35

### A Schubert Piece

- 16 bit sampling
- 5 bit sampling
- 4 bit sampling
- 3 bit sampling
- 1 bit sampling

29 Aug 2013 11-755/18-797 36

### Quantization Formats

- Sampling can be uniform
  - Sample values equally spaced out

Signal Value	Bits	Mapped to
$S \geq 3.75v$	11	$3 * \text{const}$
$3.75v > S \geq 2.5v$	10	$2 * \text{const}$
$2.5v > S \geq 1.25v$	01	$1 * \text{const}$
$1.25v > S \geq 0v$	0	0

- Or nonuniform

Signal Value	Bits	Mapped to
$S \geq 4v$	11	$4.5 * \text{const}$
$4v > S \geq 2.5v$	10	$3.25 * \text{const}$
$2.5v > S \geq 1v$	01	$1.25 * \text{const}$
$1.0v > S \geq 0v$	0	$0.5 * \text{const}$

29 Aug 2013 11-755/18-797 37

### Uniform Quantization

- At the sampling instant, the actual value of the waveform is rounded off to the nearest level permitted by the quantization
- Values entirely outside the range are quantized to either the highest or lowest values

29 Aug 2013 11-755/18-797 38

### Non-uniform Sampling

- Quantization levels are non-uniformly spaced
- At the sampling instant, the actual value of the waveform is rounded off to the nearest level permitted by the quantization
- Values entirely outside the range are quantized to either the highest or lowest values

29 Aug 2013 11-755/18-797 39

### Uniform Quantization

UPON BEING SAMPLED AT ONLY 3 BITS (8 LEVELS)

29 Aug 2013 11-755/18-797 40

### Uniform Quantization

- There is a lot more action in the central region than outside.
- Assigning only four levels to the busy central region and four entire levels to the sparse outer region is inefficient
- Assigning more levels to the central region and less to the outer region can give better fidelity
  - for the same storage

29 Aug 2013 11-755/18-797 41

### Non-uniform Quantization

- Assigning more levels to the central region and less to the outer region can give better fidelity for the same storage

29 Aug 2013 11-755/18-797 42

### Non-uniform Quantization

■ Assigning more levels to the central region and less to the outer region can give better fidelity for the same storage

29 Aug 2013 11-755/18-797 43

### Non-uniform Sampling

- Uniform sampling maps uniform widths of the analog signal to units steps of the quantized signal
- In "standard" *non-uniform* sampling the step sizes are smaller near 0 and wider farther away
  - The curve that the steps are drawn on follow a logarithmic law:
    - Mu Law:  $Y = C \cdot \log(1 + mX/C)/(1+m)$
    - A Law:  $Y = C \cdot (1 + \log(aX)/C)/(1+a)$
- One can get the same perceptual effect with 8bits of non-uniform sampling as 12bits of uniform sampling

29 Aug 2013 11-755/18-797 44

### Dealing with audio

Signal Value	Bits	Mapped to	Signal Value	Bits	Mapped to
$S \geq 3.75v$	11	3	$S \geq 4v$	11	4.5
$3.75v > S \geq 2.5v$	10	2	$4v > S \geq 2.5v$	10	3.25
$2.5v > S \geq 1.25v$	01	1	$2.5v > S \geq 1v$	01	1.25
$1.25v > S \geq 0v$	0	0	$1.0v > S \geq 0v$	0	0.5

- Capture / read audio in the format provided by the file or hardware
  - Linear PCM, Mu-law, A-law,
- Convert to 16-bit PCM value
  - i.e. map the bits onto the number on the right column
  - This mapping is typically provided by a table computed from the sample compression function
  - No lookup for data stored in PCM
- Conversion from Mu law:
  - <http://www.speech.cs.cmu.edu/comp.speech/Section2/Q2.7.html>

29 Aug 2013 11-755/18-797 45

### Images

29 Aug 2013 11-755/18-797 46

### Images

29 Aug 2013 11-755/18-797 47

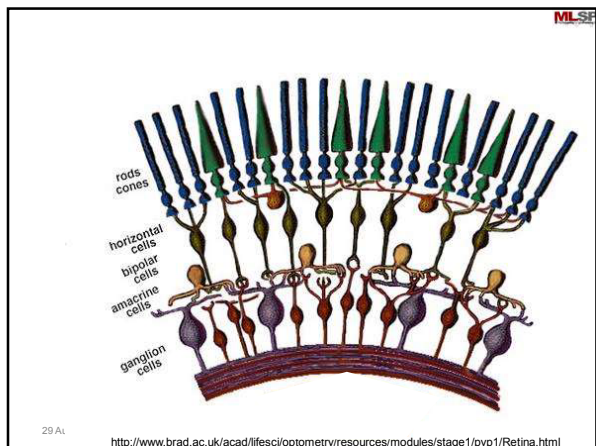

### The Eye

Retina

MLSP

## Rods and Cones

- Separate Systems
- Rods
  - Fast
  - Sensitive
  - Grey scale
  - predominate in the periphery
- Cones
  - Slow
  - Not so sensitive
  - Fovea / Macula
  - **COLOR!**

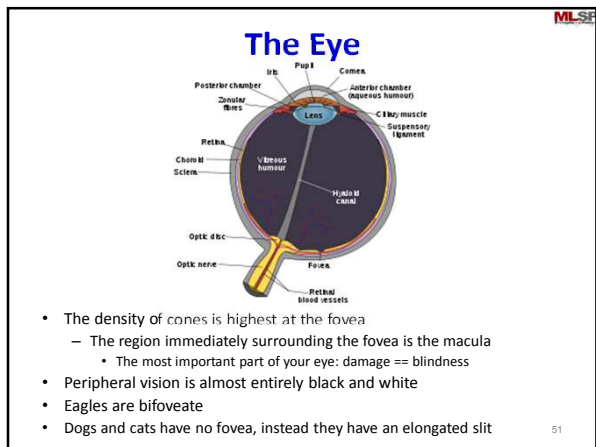

Basic Neuroscience: Anatomy and Physiology Arthur C. Guyton, M.D. 1987 W.B.Saunders Co.

29 Aug 2013

11-755/18-797

50

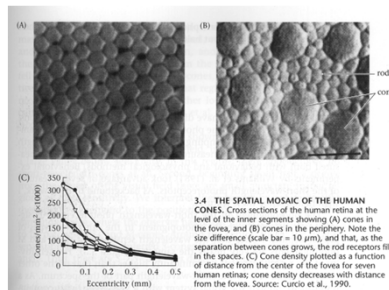

- The density of cones is highest at the fovea
  - The region immediately surrounding the fovea is the macula
    - The most important part of your eye: damage == blindness
- Peripheral vision is almost entirely black and white
- Eagles are bifoveate
- Dogs and cats have no fovea, instead they have an elongated slit

51

MLSP

## Spatial Arrangement of the Retina

(From Foundations of Vision, by Brian Wandell, Sinauer Assoc.)

29 Aug 2013

11-755/18-797

52

## Three Types of Cones (trichromatic vision)

29 Aug 2013

11-755/18-797

53

MLSP

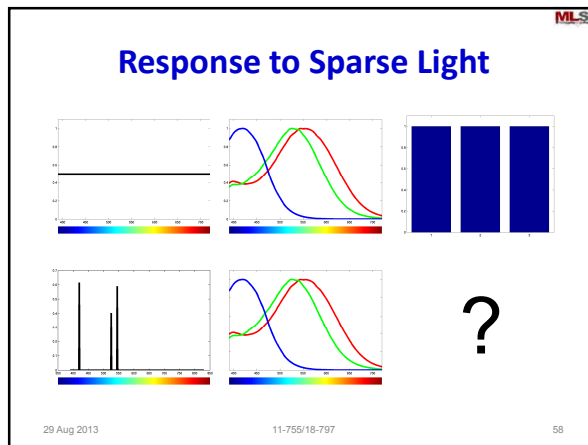

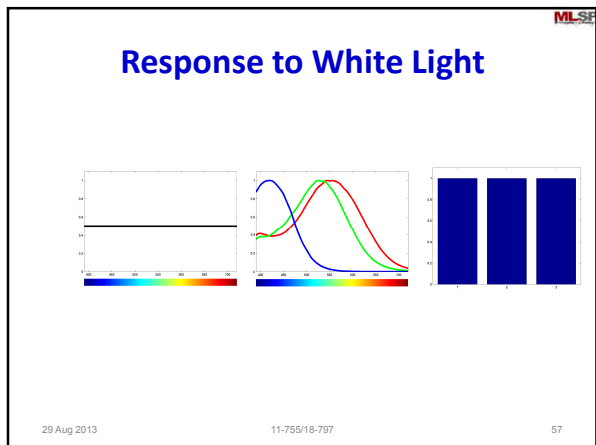

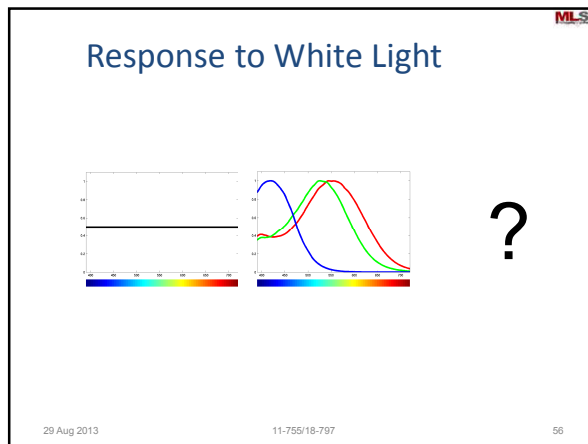

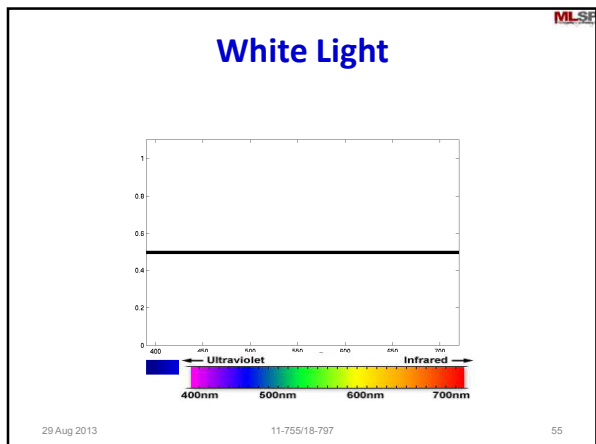

## Trichromatic Vision

- So-called "blue" light sensors respond to an entire range of frequencies
  - Including in the so-called "green" and "red" regions
- The difference in response of "green" and "red" sensors is small
  - Varies from person to person
    - Each person really sees the world in a different color
  - If the two curves get too close, we have color blindness
    - Ideally traffic lights should be red and blue

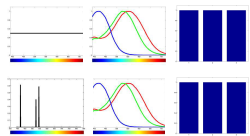

29 Aug 2013

11-755/18-797

54

## Representing Images

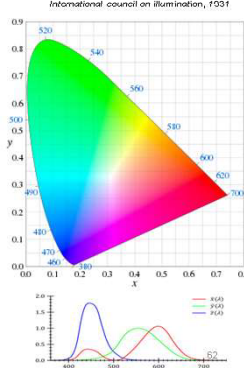

- Utilize trichromatic nature of human vision
  - Sufficient to trigger each of the three cone types in a manner that produces the sensation of the desired color
    - A tetrachromatic animal would be very confused by our computer images
      - Some new-world monkeys are tetrachromatic
- The three "chosen" colors are red (650nm), green (510nm) and blue (475nm)
  - By appropriate combinations of these colors, the cones can be excited to produce a very large set of colours
    - Which is still a small fraction of what we can actually see
  - How many colours? ...

29 Aug 2013 11-755/18-797 61

## The "CIE" colour space

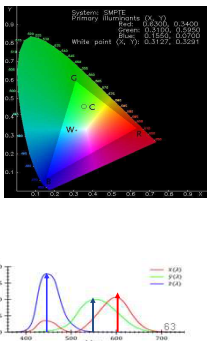

- From experiments done in the 1920s by W. David Wright and John Guild
  - Subjects adjusted x,y, and z on the right of a circular screen to match a colour on the left
- X, Y and Z are normalized responses of the three sensors
  - $X + Y + Z$  is 1.0
    - Normalized to have to total net intensity
- The image represents all colours we can see
  - The outer curve represents monochromatic light
    - X,Y and Z as a function of  $\lambda$
  - The lower line is the line of purples
    - End of visual spectrum
- The CIE chart was updated in 1960 and 1976
  - The newer charts are less popular

29 Aug 2013 11-755/18-797

## What is displayed

- The RGB triangle
  - Colours outside this area cannot be matched by additively combining only 3 colours
    - Any other set of monochromatic colours would have a differently restricted area
    - TV images can never be like the real world
- Each corner represents the (X,Y,Z) coordinate of one of the three "primary" colours used in images
- In reality, this represents a very tiny fraction of our visual acuity
  - Also affected by the quantization of levels of the colours

29 Aug 2013 11-755/18-797

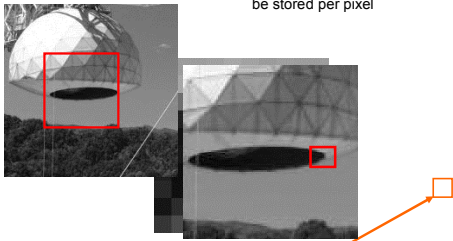

## Representing Images on Computers

- Greyscale: a single matrix of numbers
  - Each number represents the intensity of the image at a specific location in the image
  - Implicitly,  $R = G = B$  at all locations
- Color: 3 matrices of numbers
  - The matrices represent different things in different representations
  - RGB Colorspace: Matrices represent intensity of Red, Green and Blue
  - CMYK Colorspace: Cyan, Magenta, Yellow
  - YIQ Colorspace..
  - HSV Colorspace..

29 Aug 2013 11-755/18-797 64

## Computer Images: Grey Scale

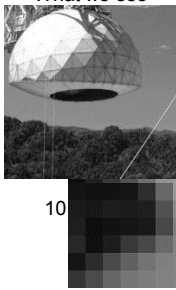

$R = G = B$ . Only a single number need be stored per pixel

Picture Element (PIXEL)  
Position & gray value (scalar)

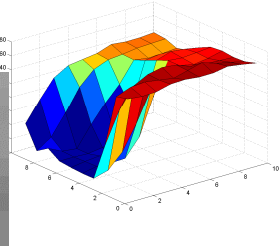

29 Aug 2013 11-755/18-797 65

### What we see

10

### What the computer "sees"

10

29 Aug 2013 11-755/18-797 66

## Image Histograms

Number of pixels having that brightness

Image brightness

29 Aug 2013 11-755/18-797 67

## Example histograms

From: Digital Image Processing, by Gonzales and Woods, Addison Wesley, 1992

**Figure 4.10** Histograms corresponding to four basic image types.

29 Aug 2013 11-755/18-797 68

## Pixel operations

- New value is a function of the old value
  - Tonescale to change image brightness
  - Threshold to reduce the information in an image
  - Colorspace operations

29 Aug 2013 11-755/18-797 69

## $J=1.5*I$

29 Aug 2013 11-755/18-797 70

## Saturation

29 Aug 2013 11-755/18-797 71

## $J=0.5*I$

29 Aug 2013 11-755/18-797 72

### J=uint8(0.75\*I)

29 Aug 2013 11-755/18-797 73

### What's this?

29 Aug 2013 11-755/18-797 74

### Non-Linear Darken

29 Aug 2013 11-755/18-797 75

### Non-Linear Lighten

29 Aug 2013 11-755/18-797 76

### Linear vs. Non-Linear

29 Aug 2013 11-755/18-797 77

### Color Images

Picture Element (PIXEL)  
Position & color value (red, green, blue)

29 Aug 2013 11-755/18-797 78

### RGB Representation

The image shows an original photograph of a yellow and white striped awning. To its right are three separate grayscale images representing the Red (R), Green (G), and Blue (B) color channels of the original image.

original

29 Aug 2013 11-755/18-797 79

### RGB Manipulation Example: Color Balance

The image shows the original photograph of the awning. To its right are the Red, Green, and Blue color channels. A fourth image shows the original photograph with a color balance adjustment applied, resulting in a cyan and magenta tint.

original

29 Aug 2013 11-755/18-797 80

### The CMYK color space

The diagram shows a 3D cube with vertices labeled: Green (top), White (center), Cyan (left), Blue (bottom-left), Magenta (bottom), Red (bottom-right), and Yellow (right). The axes are labeled G, B, and R.

Represent colors in terms of cyan, magenta, and yellow  
 – The “K” stands for “Key”, not “black”

29 Aug 2013 11-755/18-797 81

### CMYK is a *subtractive* representation

The image contains a Venn diagram with three overlapping circles of red, green, and blue, and a 3D cube diagram similar to the one in slide 81.

- RGB is based on *composition*, i.e. it is an additive representation
  - Adding equal parts of red, green and blue creates white
- What happens when you mix red, green and blue paint?
  - Clue – paint colouring is subtractive..
- CMYK is based on *masking*, i.e. it is subtractive
  - The base is white
  - Masking it with equal parts of C, M and Y creates Black
    - Yellow masks blue
  - Masking it with C and Y creates Green
    - Yellow masks blue
  - Masking it with M and Y creates Red
    - Magenta masks green
  - Masking it with M and C creates Blue
    - Cyan masks green
  - Designed specifically for *printing*
    - As opposed to rendering

29 Aug 2013 11-755/18-797 82

### An Interesting Aside

The image is a reproduction of a painting by Georges-Pierre Seurat, showing a busy outdoor scene with many figures and a dog.

- Paints create subtractive coloring
  - Each paint masks out some colours
  - Mixing paint subtracts combinations of colors
  - Paintings represent subtractive colour masks
- In the 1880s Georges-Pierre Seurat pioneered an *additive-colour* technique for painting based on “pointilism”
  - How do you think he did it?

29 Aug 2013 11-755/18-797 83

### NTSC color components

Y = “luminance”  
 I = “red-green”  
 Q = “blue-yellow”

a.k.a. YUV although YUV is actually the color specification for PAL video

The diagram shows a 3D coordinate system with a vertical axis labeled L=100 White at the top and Black L=0 at the bottom. The horizontal plane is a color wheel with labels: -a Green, +b Yellow, +a Red, and -b Blue.

### YIQ Color Space

$$\begin{bmatrix} Y \\ I \\ Q \end{bmatrix} = \begin{bmatrix} .299 & .587 & .114 \\ -.596 & -.275 & -.321 \\ .212 & -.523 & .311 \end{bmatrix} \begin{bmatrix} R \\ G \\ B \end{bmatrix}$$

29 Aug 2013 11-755/18-797 85

### Color Representations

- Y value lies in the same range as R,G,B ([0,1])
- I is to [-0.59 0.59]
- Q is limited to [-0.52 0.52]
- Takes advantage of lower human sensitivity to I and Q axes

29 Aug 2013 11-755/18-797 86

### YIQ

- Top: Original image
- Second: Y
- Third: I (displayed as red-cyan)
- Fourth: Q (displayed as green-magenta)
  - From <http://wikipedia.org/>
- Processing (e.g. histogram equalization) only needed on Y
  - In RGB must be done on all three colors. Can distort image colors
  - A black and white TV only needs Y

29 Aug 2013 11-755/18-797 87

### Bandwidth (transmission resources) for the components of the television signal

Understanding image perception allowed NTSC to add color to the black and white television signal. The eye is more sensitive to I than Q, so lesser bandwidth is needed for Q. Both together used much less than Y, allowing for color to be added for minimal increase in transmission bandwidth.

### Hue, Saturation, Value

$V = [0,1], S = [0,1], H = [0,360]$

The HSV Colour Model By Mark Roberts <http://www.cs.bham.ac.uk/~mer/colour/hsv.html>

29 Aug 2013 11-755/18-797 89

### HSV

- V = Intensity
  - 0 = Black
  - 1 = Max (white at S = 0)
- S = 1:
  - As H goes from 0 (Red) to 360, it represents a different combinations of 2 colors
- As S->0, the color components from the opposite side of the polygon increase

$V = [0,1], S = [0,1], H = [0,360]$

29 Aug 2013 11-755/18-797 90

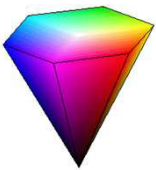

## Hue, Saturation, Value

$$h = \begin{cases} 0, & \text{if } \max = \min \\ 60^\circ \times \frac{b-g}{\max - \min} + 360^\circ \text{ mod } 360^\circ, & \text{if } \max = r \\ 60^\circ \times \frac{b-r}{\max - \min} + 120^\circ, & \text{if } \max = g \\ 60^\circ \times \frac{r-g}{\max - \min} + 240^\circ, & \text{if } \max = b \end{cases}$$

$$s = \begin{cases} 0, & \text{if } \max = 0 \\ \frac{\max - \min}{\max} = 1 - \frac{\min}{\max}, & \text{otherwise} \end{cases}$$

$v = \max$

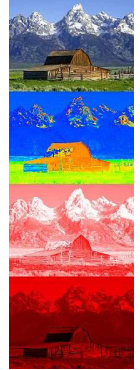

*Max* is the maximum of (R,G,B)  
*Min* is the minimum of (R,G,B)

## Quantization and Saturation

- Captured images are typically quantized to N-bits
- Standard value: 8 bits
- 8-bits is not very much < 1000:1
- Humans can easily accept 100,000:1
- And most cameras will give you 6-bits anyway...

93

## Processing Colour Images

- Typically work only on the Grey Scale image
  - Decode image from whatever representation to RGB
  - GS = R + G + B
- The Y of YIQ may also be used
  - Y is a linear combination of R,G and B
- For specific algorithms that deal with colour, individual colours may be maintained
  - Or any linear combination that makes sense may be maintained.

## Other Signals

- Direct measurement (like sound):
  - ECG, EMG, EKG
- Indirect measurement (through a transform)
  - MRI
    - Takes measurements in the *Fourier domain*

## The General Theory of Sensing

- Actual signal :  $y(j)$ 
  - $j$  may be time, position, etc..
  - Usually continuously valued
- Captured value:
  - $y(J) = \int_{\Theta} y(j)K(j-J)dj$  ;  $\Theta$  is the space of all  $j$
  - $K(j)$  is a measurement kernel
  - Ideally a *delta* (which takes non-zero value only at the desired  $j$ )
    - Captures *actual* snapshots
  - But in reality not
    - More on this later..
