

# Federated Learning under Distributed Concept Drift

**Ellango Jothimurugesan**  
**Carnegie Mellon University**

Joint work with Kevin Hsieh (Microsoft), Jianyu Wang (CMU), Gauri Joshi (CMU), Phillip B. Gibbons (CMU)

# Federated Learning: Continual On-Device Training

Centralized learning:

- Train a model on all data, then deploy

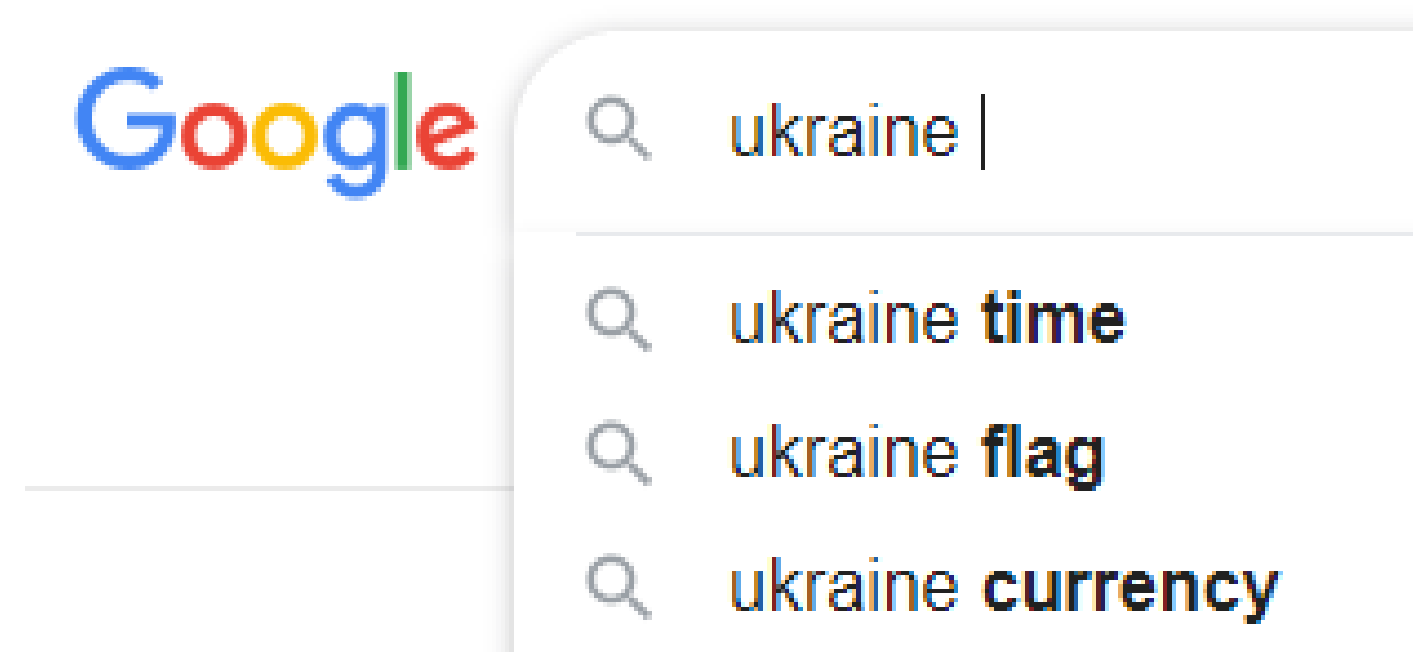

Federated Learning (FL):

- Clients continually compute updates to the model with new data
- Server continually aggregates updates

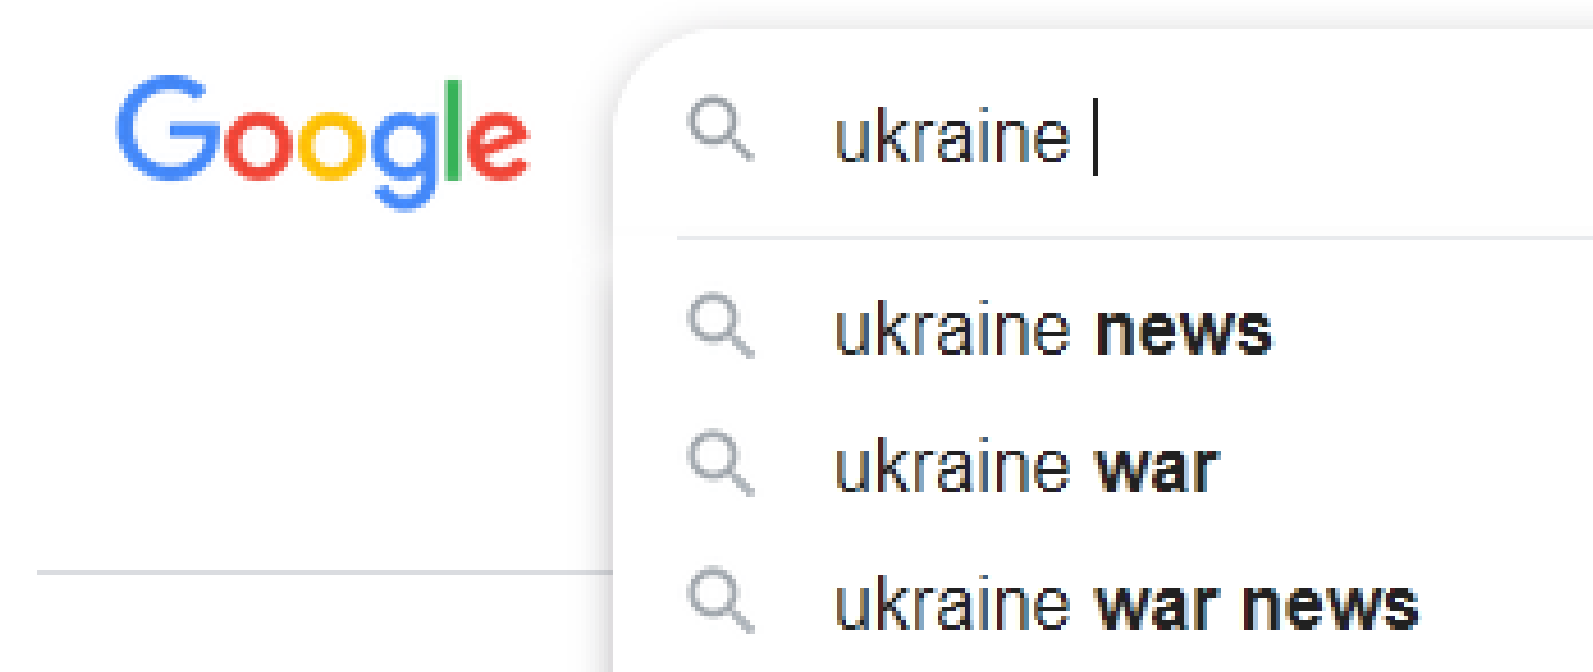

# Concept Drift

- The data distribution (concept) can change over time
- Ex: next word prediction

Jan 2022

Feb 2022

- No single model captures both concepts

# Challenges of FL under Distributed Concept Drift

Drifts occur staggered in time across clients

Multiple concepts may arise at the same time

# Real-world Example: Localized Drift in FMoW

Functional Map of the World (FMoW):  
identify building type from satellite  
images

- Globally, drift is small compared to local drift for Africa
- Global model has only 48% accuracy on Africa post-2014, compared to 66% on rest of the world

# Training a Single Global Model is Suboptimal

Observations from single concept change on SEA dataset staggered over time

- Locally: Drift occurs abruptly  
Globally: Performance degrades slowly & drift is harder to detect
- Any single global model cannot fit both concepts during the transition

# FedDrift Learns the Clustering of Clients

- FedDrift employs multiple models, each trained by a time-varying cluster of clients
- Challenge: determining the right number of clusters

|   |   |   |   |   |   |   |   |   |   |
|---|---|---|---|---|---|---|---|---|---|
| 0 | 0 | 1 | 1 | 4 | 4 | 4 | 7 | 7 | 0 |
| 0 | 0 | 2 | 1 | 4 | 4 | 7 | 7 | 0 | 0 |
| 0 | 0 | 3 | 1 | 1 | 4 | 4 | 4 | 7 | 7 |
| 0 | 0 | 4 | 4 | 1 | 1 | 1 | 7 | 7 | 7 |
| 0 | 0 | 5 | 4 | 4 | 4 | 1 | 1 | 7 | 7 |
| 0 | 0 | 6 | 6 | 4 | 9 | 7 | 7 | 1 | 1 |
| 0 | 0 | 0 | 0 | 4 | 4 | 7 | 7 | 7 | 4 |
| 0 | 0 | 0 | 0 | 8 | 1 | 1 | 4 | 4 | 4 |
| 0 | 0 | 0 | 7 | 7 | 7 | 7 | 1 | 1 | 4 |
| 0 | 0 | 0 | 0 | 0 | 0 | 7 | 7 | 7 | 7 |

time →

Example clustering  
Color: Ground-truth  
Number: Cluster ID

1. Eager Splitting  
Isolate clients into individual clusters via local drift detection of size  $\delta$

2. Lazy Merging  
Merge clusters via hierarchical clustering up to distance  $\delta$

Cluster distances are the pairwise drift

Ideally, clusters correspond 1-to-1 with concepts

# Experimental Results: Single Staggered Drift

E.g., Single concept change on SEA dataset staggered over time

time →

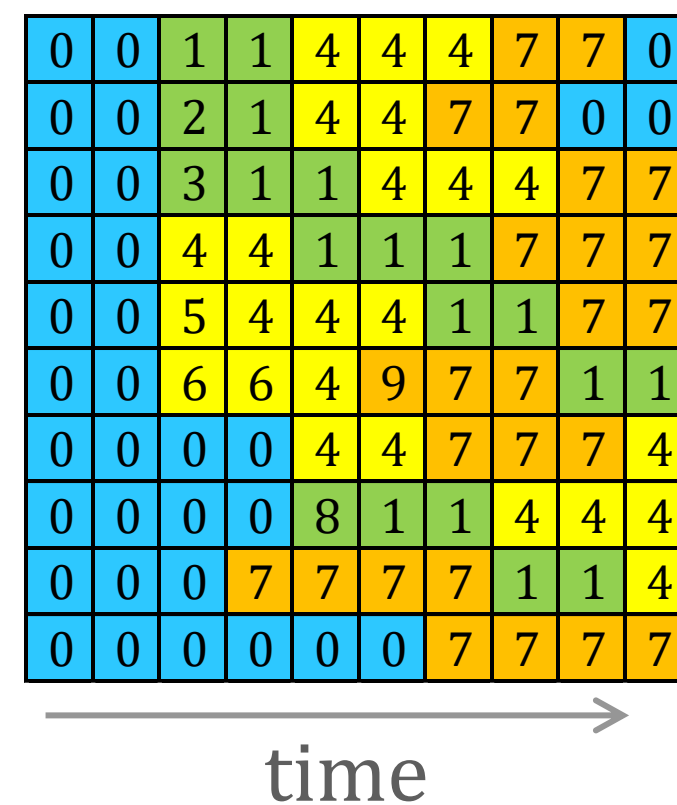

- Oracle has access to matrix, trains a model specialized for each concept
- FedDrift's accuracy is stable and comparable to Oracle

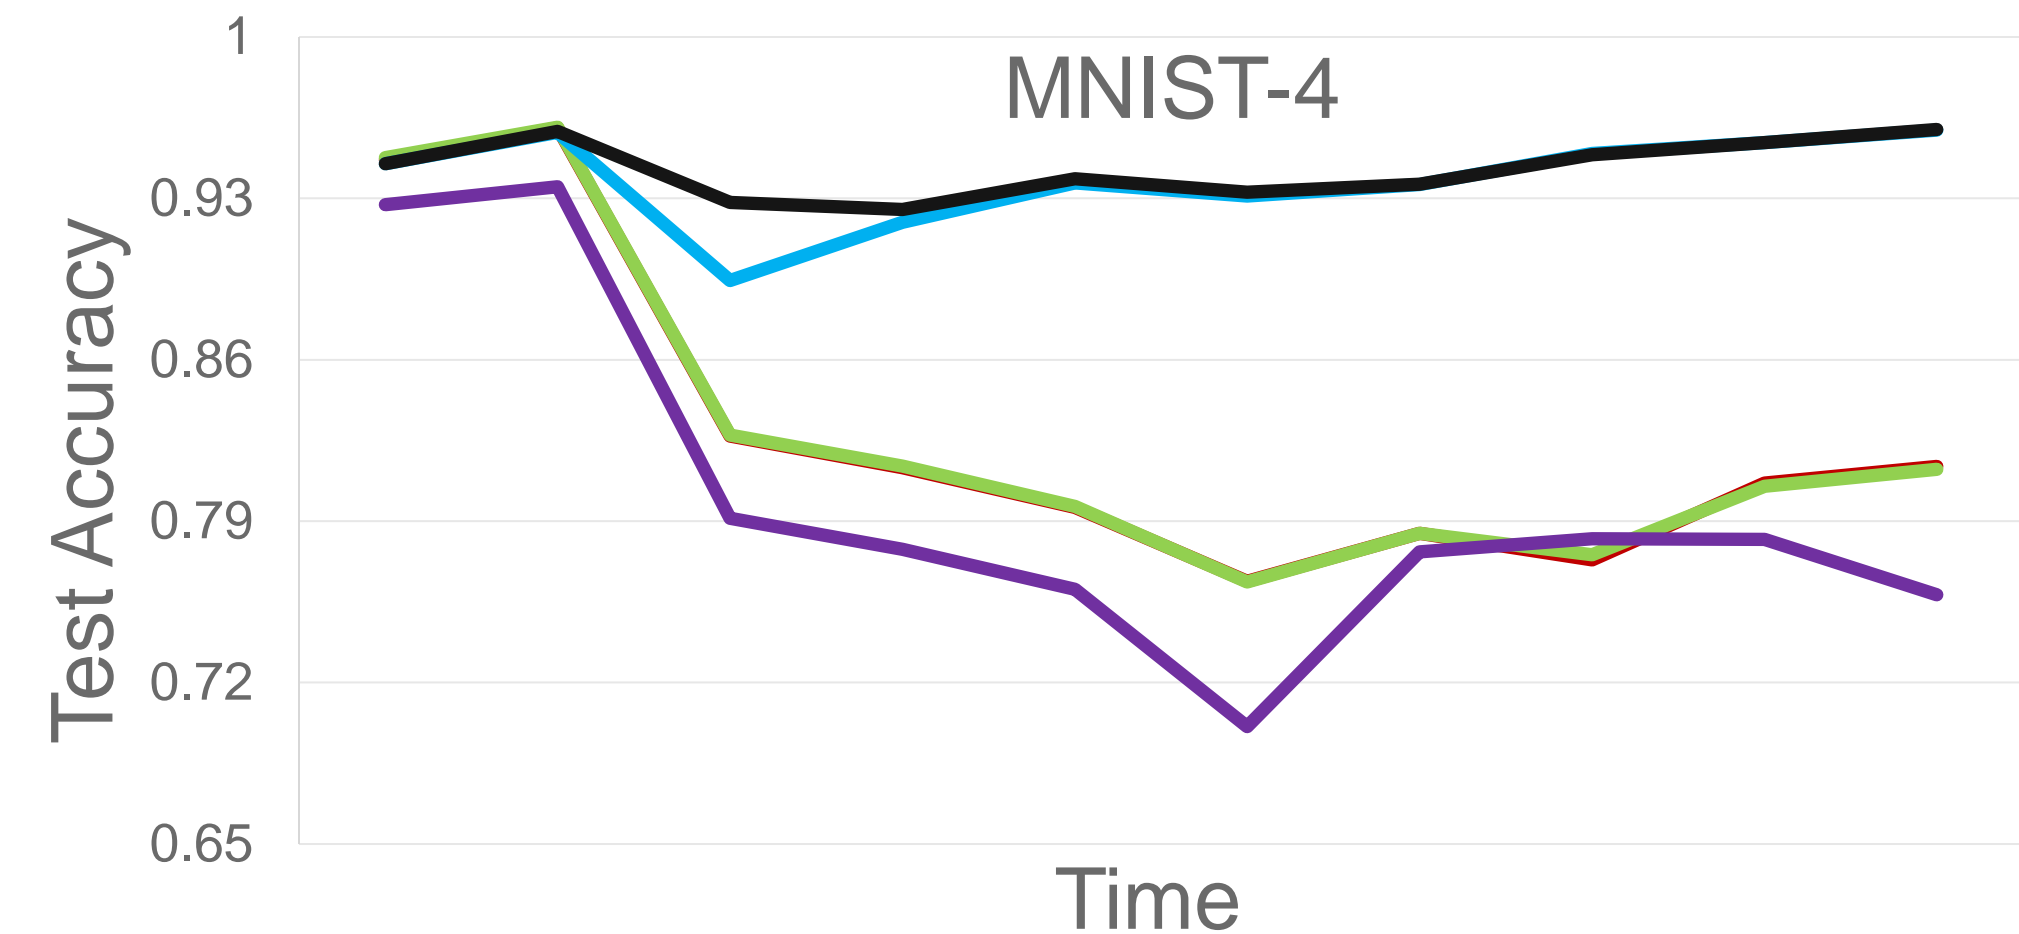

# Experimental Results: More General Drifts

- On the 4-concept drift, FedDrift is comparable to Oracle

- On the real-world drift in FMoW, FedDrift outperforms the best baseline (64% to 58%)

— FedAvg (No adaptation)   
 — DriftSurf (Detection)   
 — KUE (Ensemble)   
 — FedDrift (Ours)   
 — Oracle (Ground truth)

# FedDrift's Accuracy Higher Than Prior Work

Table 2: Average accuracy (%) across all clients and time (over 5 trials)

|                 | SINE-2                             | CIRCLE-2                           | SEA-2                              | MNIST-2          | SEA-4                              | MNIST-4                            | FMoW                               |
|-----------------|------------------------------------|------------------------------------|------------------------------------|------------------|------------------------------------|------------------------------------|------------------------------------|

# Takeaways

- Our work is the first to study drifts distributed both over time and across clients in federated learning
- Existing centralized solutions fail on staggered drifts
- FedDrift's **eager splitting** and **lazy merging** accurately clusters
- FedDrift achieves high accuracy on variety of drifts
  - Comparable to an idealized oracle algorithm on synthetic datasets
  - Outperforms the best baseline (64% to 58%) on the real-world FMoW
