

# Computational Genomics

Introduction to cell biology,  
genomics, development, and  
probability

Eric Xing

Lecture 1a, January 18, 2007

Reading: Chap. 1, DTM book

## Introduction to cell biology, functional genomics, development, etc.

- What system to use?
  - How informative it is?
  - How much we can generalize?
  - How much shall we believe?
  - How much we can validate our results? How?
- 
- How to avoid being **naïve** when doing compbio?

## Model Organisms

## Bacterial Phage: T4

## Bacteria: E. Coli

**The Budding Yeast:**  
***Saccharomyces cerevisiae***

**The Fission Yeast:**  
***Schizosaccharomyces pombe***

## The Nematode: *Caenorhabditis elegans*

- SMALL: ~ 250  $\mu\text{m}$
- TRANSPARENT
- 959 CELLS
- 300 NEURONS
- SHORT GENERATION TIME
- SIMPLE GROWTH MEDIUM
- SELF- FERTILIZING HERMAPHRODITE
- RAPID ISOLATION AND CLONING OF MULTIPLE TYPES OF MUTANT ORGANISMS

## The Fruit Fly: *Drosophila Melanogaster*

Normal

*Ubx* mutant

# The Mouse

transgenic for human growth hormone

# Prokaryotic and Eukaryotic Cells

(a) Prokaryotic cell

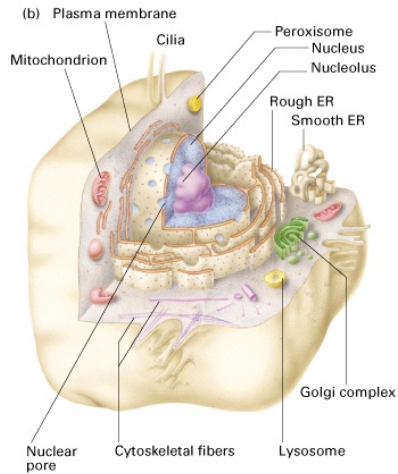

(b) Eukaryotic cell

# A Close Look of a Eukaryotic Cell

## The structure:

## The information flow:

# Cell Cycle

# Signal Transduction

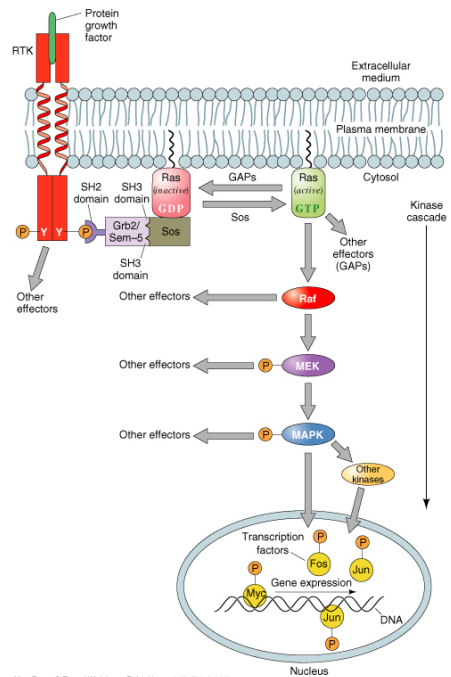

- A variety of plasma membrane receptor proteins bind extracellular signaling molecules and transmit signals across the membrane to the cell interior

(c) Tyrosine kinase-linked receptors (erythropoietin, interferons)

# Signal Transduction Pathway

# The Genome

# A Multi-resolution View of the Chromosome

## DNA Content of Representative Types of Cells

Organism	Number of base pairs (millions)	Number of encoded proteins	Number of chromosomes
<b>PROKARYOTIC</b>			
<i>Mycoplasma genitalum</i> (Bacterium)	0.58	470	1
<i>Helicobacter pylori</i> (Bacterium)	1.67	1590	1
<i>Haemophilus influenza</i> (Bacterium)	1.83	1743	1
<b>EUKARYOTIC</b>			
<i>Saccharomyces cerevisiae</i> (yeast)	12	5885	17
<i>Drosophila melanogaster</i> (insect)	165	13,601	4
<i>Caenorhabditis elegans</i> (worm)	97	19,099	6
<i>Homo sapiens</i> (human)	2900	30,000 TO 40,000	23
<i>Arabidopsis thaliana</i> (plant)	125	25,498	10

## Functional Genomics

- The various **genome projects** have yielded the complete DNA sequences of many organisms.
  - E.g. human, mouse, yeast, fruitfly, etc.
  - Human: 3 billion base-pairs, 30-40 thousand genes.
- Challenge: **go from sequence to function**,
  - i.e., define the role of each gene and understand how the genome functions as a whole.

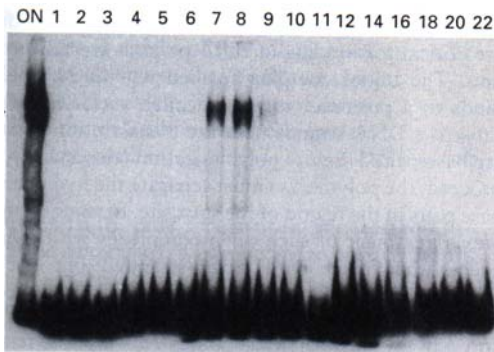

# Regulatory Machinery of Gene Expression

# Classical Analysis of Transcription Regulation Interactions

“Gel shift”: electrophoretic mobility shift assay (“EMSA”) for DNA-binding proteins

Disadvantage: requires stable complex; little “structural” information about which protein is binding

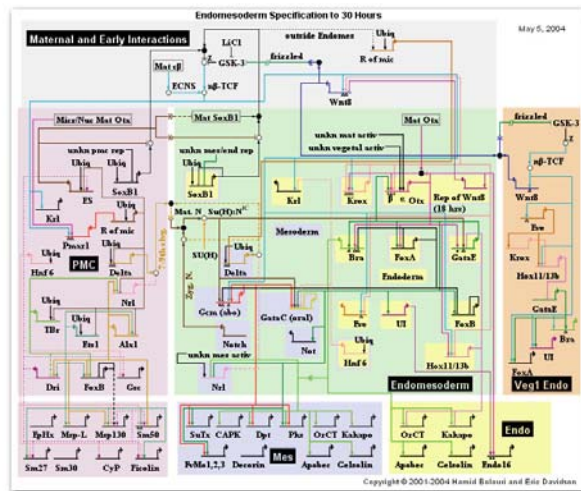

# Modern Analysis of Transcription Regulation Interactions

- Genome-wide Location Analysis (ChIP-chip)

# Gene Regulatory Network

# Biological Networks and Systems Biology

# Gene Regulatory Functions in Development

Figure 29.15 In each axis-determining system, localized products in the egg cause other maternal RNAs or proteins to be broadly localized at syncytial blastoderm, and zygotic RNAs are transcribed in bands at cellular blastoderm.

	Anterior system	Posterior system	Dorsal-ventral system
<b>Egg</b> Products transported or activated by nurse or follicle cells	bicoid RNA is anterior	nunchback RNA is ubiquitous; nanos RNA is posterior	Toll protein is ubiquitous; spätzle protein (and therefore Toll) is activated ventrally
<b>Syncytial blastoderm</b> Maternal RNAs are translated	bicoid protein forms gradient	nanos protein is in posterior half	dorsal protein is cytoplasmic
<b>Cellular blastoderm</b> Zygotic RNAs are transcribed	hunchback RNA fills anterior region	stripes of Krüppel & giant RNA	Ubx & zen RNA are dorsal
		knirps, giant	twist & snail RNA are ventral

# Temporal-spatial Gene Regulation and Regulatory Artifacts

A normal fly

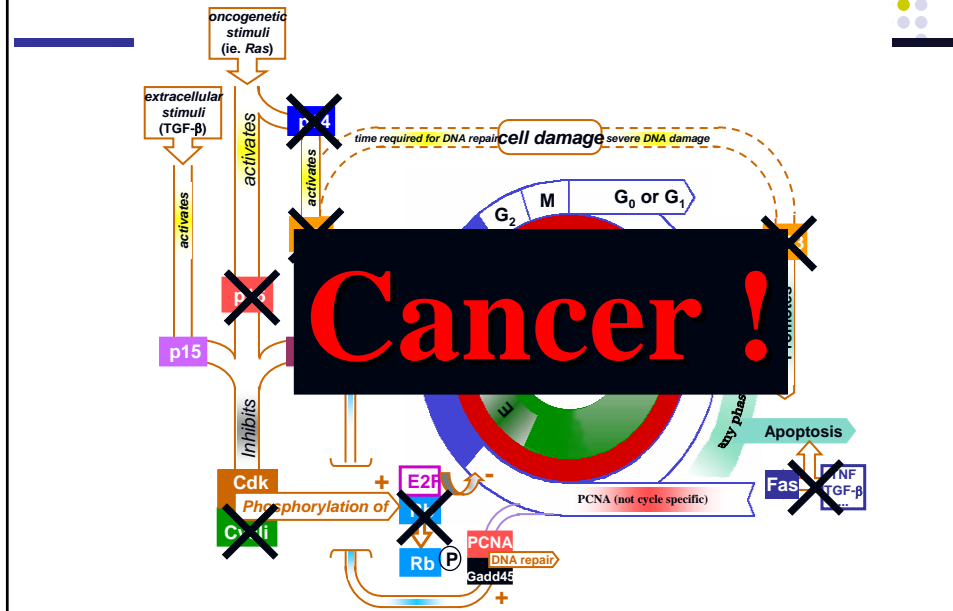

Hopeful monster?

# Microarray or Whole-body ISH?

# Gene Regulation and Carcinogenesis

# The Pathogenesis of Cancer

# Genetic Engineering: Manipulating the Genome

- **Restriction Enzymes**, naturally occurring in bacteria, that cut DNA at very specific places.

# Recombinant DNA

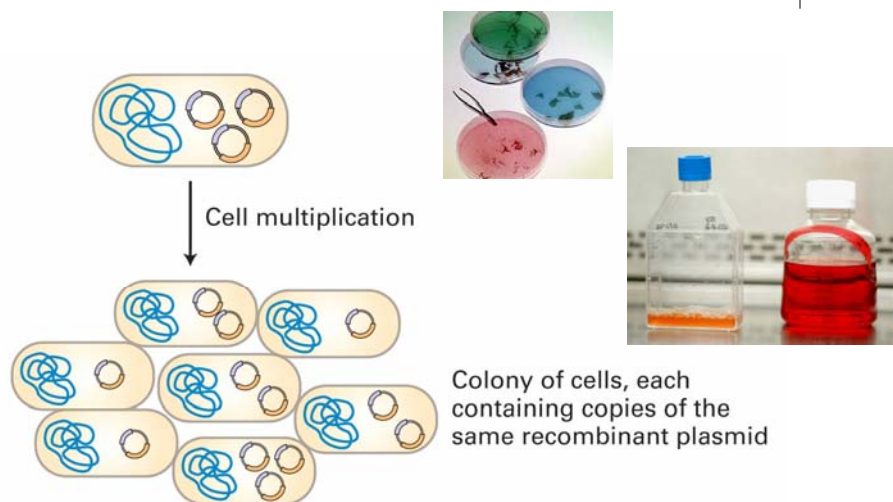

# Transformation

# Formation of Cell Colony

## How was Dolly cloned?

- Dolly is claimed to be an exact genetic replica of another sheep.

### 2. The making of Dolly

- Is it exactly "exact"?

## Definitions

- **Recombinant DNA:** Two or more segments of DNA that have been combined by humans into a sequence that does not exist in nature.
- **Cloning:** Making an exact genetic copy. A **clone** is one of the exact genetic copies.
- **Cloning vector:** Self-replicating agents that serve as vehicles to transfer and replicate genetic material.

# Software and Databases

- NCBI/NLM Databases Genbank, PubMed, PDB
  - DNA
  - Protein
  - Protein 3D
  - Literature

**Entrez**
