# Background

Task of multiple object tracking: given a video sequence and corresponding object detections in key frames, the algorithm needs to associate detections among different frames into trajectories.

Zhang, S., Wang, J., Wang, Z., Gong, Y. and Liu, Y., 2015. Multi-target tracking by learning local-to-global trajectory models. *Pattern Recognition*, 48(2), pp.580-590.

# Background

Core problem of multiple object tracking based on “tracking-by-detection”:

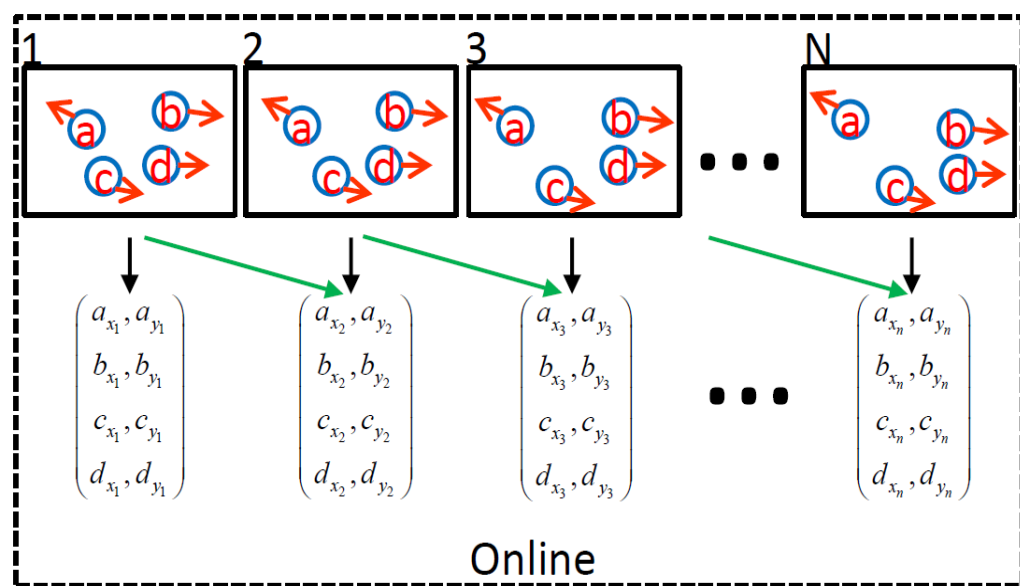

How to determine the relationship among object detections in different frames? (Data association)

An illustration of the *data association* process in the “tracking-by-detection” framework.

Luo, W., Xing, J., Zhang, X., Zhao, X. and Kim, T.K., 2014. Multiple object tracking: A literature review. *arXiv preprint arXiv:1409.7618*.

# Background

Multiple object tracking based on online data association.

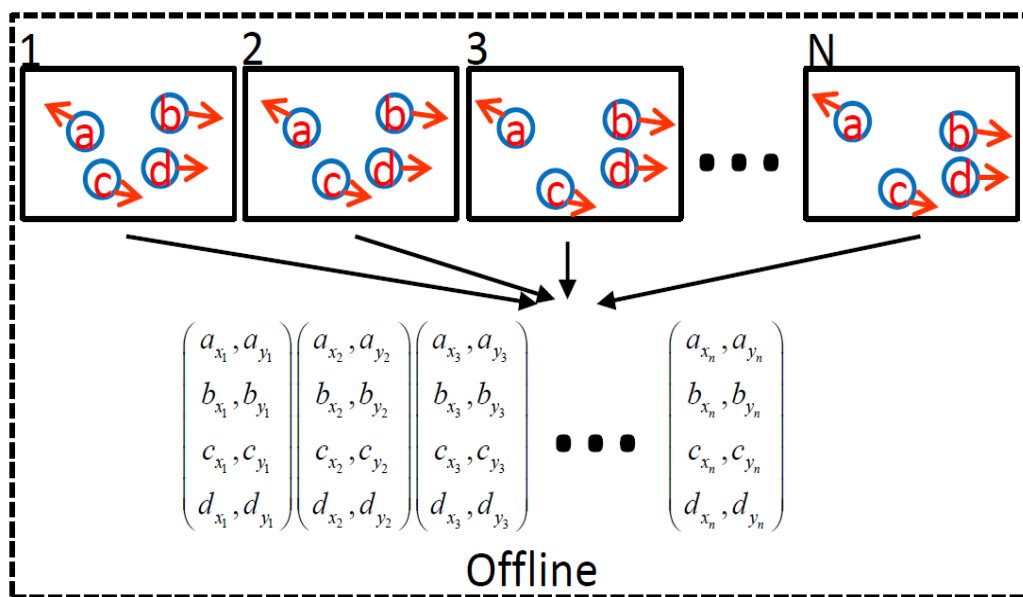

Similarity between object detection and tracklet :  $sim(o_i^t, d_k^t) = w^T \Phi(o_i^t, d_k^t) + b$

Luo, W., Xing, J., Zhang, X., Zhao, X. and Kim, T.K., 2014. Multiple object tracking: A literature review. *arXiv preprint arXiv:1409.7618*.

**Online style** data association:

- Handle tracking targets frame-by-frame;
- Only associate object detections in present frame with previous generated trajectories;
- Capable of handling online and real-time video data;
- Usually based on efficient probabilistic/deterministic optimization models;
- Tracklet drifting and ID-switching may occur when handling long-term video data.

# Background

Multiple object tracking based on offline data association.

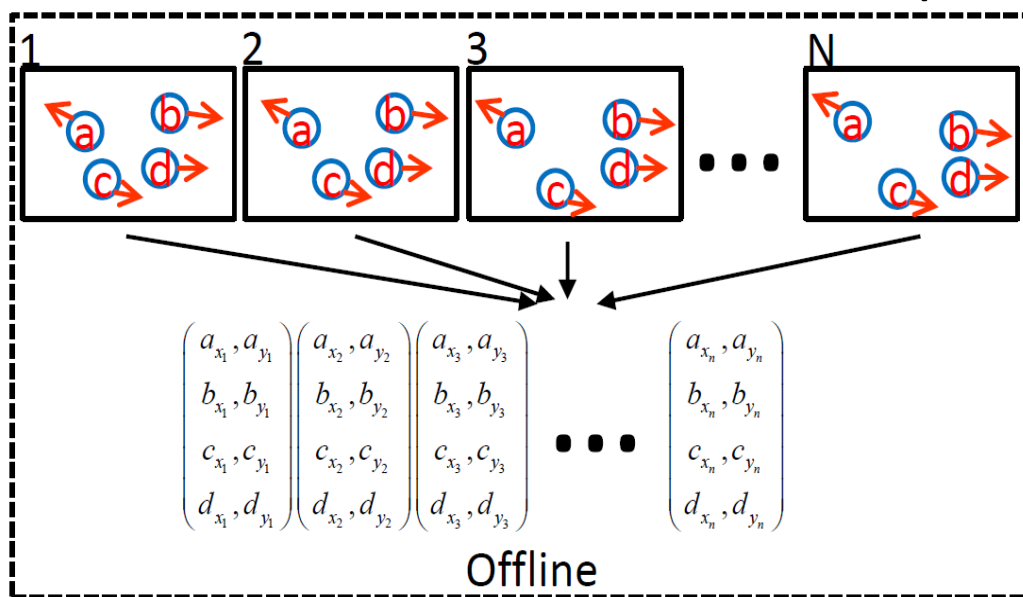

**Offline style** data association:

- Handle object detections from all frames in a batch manner;
- Trajectories are more robust with the observations from future frames;
- Only capable of handling offline video data;
- Usually formulated as min-cost or max-flow problem in graph;
- Seeking hierarchy solution for long-term videos: the error may also accumulated.

Luo, W., Xing, J., Zhang, X., Zhao, X. and Kim, T.K., 2014. Multiple object tracking: A literature review. *arXiv preprint arXiv:1409.7618*.

# Background

Intuition: Could we adapt an efficient online mode tracker to handle offline video data, while still preserving the tracking accuracy?

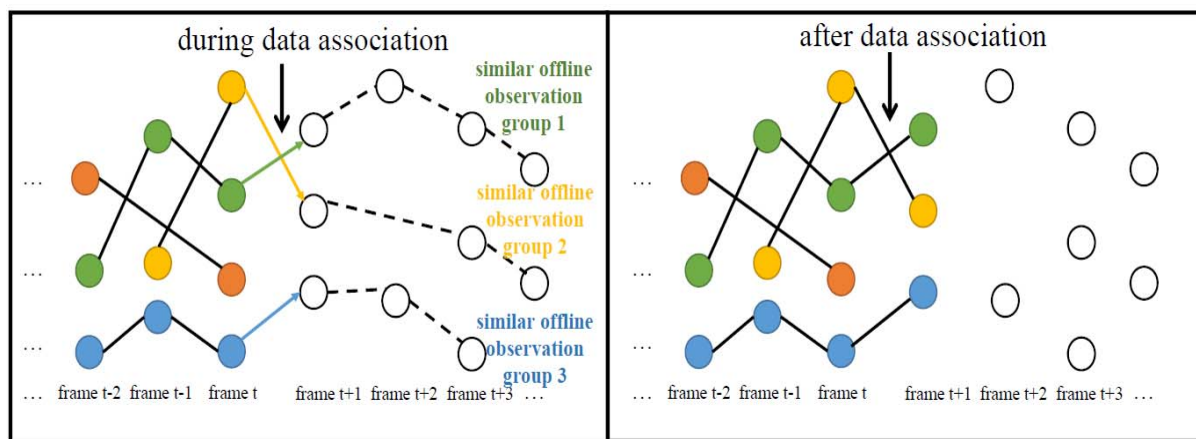

Multiple object tracking based on offline data association.

**Offline style** data association:

- Handle object detections from all frames in a batch manner;
- Trajectories are more robust with the observations from future frames;
- Only capable of handling offline video data;
- Usually formulated as min-cost or max-flow problem in graph;
- Seeking hierarchy solution for long-term videos: the error may also accumulated.

Luo, W., Xing, J., Zhang, X., Zhao, X. and Kim, T.K., 2014. Multiple object tracking: A literature review. *arXiv preprint arXiv:1409.7618*.

# Proposed methodology

An illustration of the data association process of our proposed mixed style tracker.

## **Mixed style** data association:

- The “Rewind to track” strategy: proposed to generate backward multiple object tracklets;
- The “similar offline observation group” (dotted line), outputted by the “Rewind to track”, is employed for robust similarity measurement;
- The final trajectories are still formulated in an online manner to preserve the efficiency;
- Only associate detections in present frame : error will not be accumulated.

Similarity between object detection and tracklet : 
$$sim(o_i^t, d_k^t) = \sum_{q=0}^{t'} w^T \Phi(o_i^t, d_k^{t,q}) + b,$$

# Proposed methodology

Multiple object tracking based on Markov Decision Process (MDP). The agent's state transition map of a tracking object.

Xiang, Y., Alahi, A. and Savarese, S., 2015. Learning to track: Online multi-object tracking by decision making. In *Proceedings of the IEEE International Conference on Computer Vision* (pp. 4705-4713).

# Proposed methodology

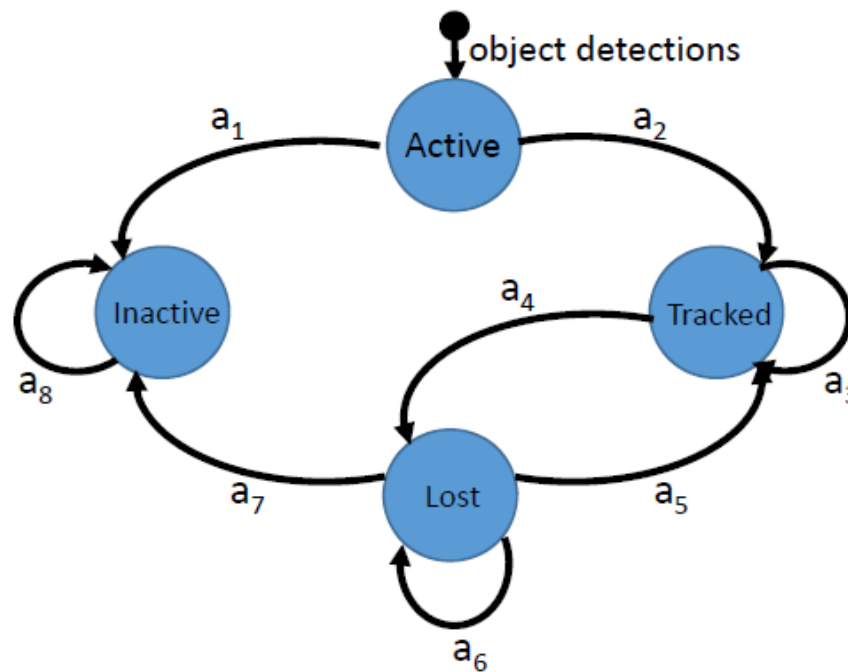

The agent's state transition map of a tracking object.

An agent's of a particular tracking object could be represented with a tuple  $(s, a, \pi, R(s, a))$ .

- $s \in S$  : **state**, an object's status in a particular frame, generated according to tracklets;
- $a \in A$  : **action**, transit an object from one state to another;
- $\pi(s)$  : **policy function**, determine a mapping from the state space  $S$  to the action space  $A$ :  $\pi(s) \rightarrow a$  , via maximizing the reward function;
- $R(s, a)$  : real-valued **reward function**  $R(s, a) : S \times A \rightarrow R$  , define a reward value by executing action  $a$  in state  $s$ .

# Proposed methodology

States description:

- Active : any newly appeared object detection is initialized with this state;
- Tracked : the agent will be kept in this state, if and only if its historical tracklets could be extended to the present frame (based on TLD tracking assumption);
- Lost : object is disappeared or occluded. Next state may be: (1) back to Tracked state; (2) keep Lost state; (3) transfer to Inactive state (equivalent to solving the data association problem) ;
- Inactive : represents invalid object detections or permanent lost objects.

The agent's state transition map of a tracking object.

# Proposed methodology

- Given the agent feature  $\Phi(s)$  in state  $s$ , the reward function could be represented by a linear mapping from the feature:

$$R(s, a) = w \cdot \Phi(s)$$

- at frame  $t_0$ , the tracker adapts policy  $\pi(s_{t_0}) \rightarrow a_{t_0}$ . The corresponding value expectation  $E[V^\pi(s_{t_0})]$  (the afterwards reward by adapting  $a_{t_0}$ ) is:

$$E[V^\pi(s_{t_0})] = w \cdot \mu(\pi) ,$$

where as  $\mu(\pi) = E[\sum_{t=t_0}^{\infty} \gamma^t \Phi(s) | \pi]$ , which is the feature expectation of the agent ( $\gamma$  is the decay factor,  $0 \leq \gamma \leq 1$ ).

# Proposed methodology

- Given the agent feature  $\Phi(s)$  in state  $s$ , the reward function could be represented by a linear map of the feature:

$$R(s) = w \cdot \Phi(s)$$

- at frame  $t_0$ , the tracker adapts policy  $\pi(s_{t_0}) \rightarrow a_{t_0}$ . The corresponding value expectation  $E[V^\pi(s_{t_0})]$  (the afterwards reward by adapting  $a_{t_0}$ ) is:

$$E[V^\pi(s_{t_0})] = w \cdot \mu(\pi) ,$$

where as  $\mu(\pi) = E[\sum_{t=t_0}^{\infty} \gamma^t \Phi(s) | \pi]$ , which is the feature expectation of the agent ( $\gamma$  is the decay factor,  $0 \leq \gamma \leq 1$ ).

reward  
function is  
unknown

policy  
function is  
unknown

# Proposed methodology

- Unknown: both the reward function and the policy function
- Known: labelled groundtruth objects' trajectories on the training set, i.e., the expert's state-action sequences:

$$D = \{s_{t_1}, a_{t_1}, s_{t_2}, a_{t_2}, \dots, s_{t_n}, a_{t_n}\}$$

- Objective: minimizing difference between expert's and algorithm's reward expectation:

$$\min ||E^*[V^\pi(s_{t_i})] - \tilde{E}[V^\pi(s_{t_i})]||$$

- solve the optimal policy function parameter:  $\tilde{\pi}$  (Reinforcement Learning)
- solve the optimal reward function parameter:  $\tilde{R}(s, a)$  (Inverse Reinforcement Learning)

\*Apprenticeship Learning: Reinforcement Learning + Inverse Reinforcement Learning

# Proposed methodology

Q: How to training multiple agents in a particular training video?

A1: Sequentially (polling variant of AL); A2: Parallely (parallel variant of AL)

# Proposed methodology

Q: How to training multiple agents in a particular training video?

A1: Sequentially (polling variant of AL); A2: Parallely (parallel variant of AL)

- RL phase, parallely learning the reward function:

$$w^{(p)} = \arg \max_w \min \sum_{j=1}^N w^T (\mu_j(\pi^{(p-1)}) - \mu_{E,j}(\pi^{(p-1)})),$$

- IRL phase, parallely updating policy function parameters :

$$\pi^{(p)} = \arg \max_{\pi} \sum_{j=1}^N E[V_j^{\pi}(s_t)] |_{\tilde{R}^{(p)}(s,a)=w^{(p)} \cdot \phi(s)},$$

- Multiple agents feature updating :

$$\forall j, \mu_j^{(p)} = \mu_j(\pi^{(p)}).$$

---

**Algorithm 1** Parallelized apprenticeship learning for *lost* state with backward tracklets utilization.

---

**Input:** Video sequences  $V = \{v_i\}_{i=1}^N$ , ground truth trajectories  $O_i = \{o_{i,j}\}_{j=1}^{N_i}$  and object detections  $D_i = \{d_j^i\}_{j=1}^{N_i}$ ;

**Output:** reward function parameters  $(w_{lost}, b_{lost})$  for lost status data association;

- 1: Initialization of reward function:  $w_{lost}^0 \leftarrow w_0, b_{lost}^0 \leftarrow b_0, S \leftarrow \emptyset$
- 2: Initialization for each target  $o_{i,j}$  in each  $v_i$ : set MDP of  $o_{i,j}$  in *tracked* after  $t_{start}(i,j) \leftarrow$  index of the first frame where  $o_{i,j}$  correctly detected
- 3:  $p \leftarrow 0$
- 4: **repeat**
- 5:      $p \leftarrow p + 1$
- 6:     **for** each video  $v_i$  in  $V$  **do**
- 7:          $t \leftarrow 1$
- 8:         **while**  $t \leq$  last frame of  $v_i$  **do**
- 9:             **for** target  $o_{i,j}$  in  $v_i$  which  $t_{start}(i,j) \geq t$  **do**
- 10:                 Follow policy  $\pi^{p-1}$ , compute  $\mu_{i,j}^{\pi}$  as Eq.6, choose action  $a$
- 11:                 Compute ground truth action:  $a_{gt}$
- 12:                 **if** state is *lost* and  $a \neq a_{gt}$  **then**
- 13:                      $S \leftarrow S \cup \{\phi(o_{i,j}^t, d_k^t), y_k\}$
- 14:                      $S \leftarrow S \cup \{\phi(o_{i,j}^t, d_k^{t,q}); y_k\}, 1 \leq q \leq t'$
- 15:                     Save failure position:  $t_{start}(i,j) \leftarrow t$
- 16:                 **else**
- 17:                     State transfer: Execute action  $a$
- 18:                 **end if**
- 19:                 **If** all targets failed **then break;**
- 20:             **end for**
- 21:         **end while**
- 22:     **end for**
- 23:     Obtain new reward function parameters  $(w_{lost}^p, b_{lost}^p)$ : solve Eq.4 with  $S$
- 24:     Obtain new policy  $\pi^p$ : solve Eq.5 with  $(w_{lost}^p, b_{lost}^p)$
- 25: **until** all targets are successfully tracked.

---

# Proposed methodology

Q: How to training multiple agents in a particular training video?

A1: Sequentially (polling variant of AL); A2: Parallely (parallel variant of AL)

- RL phase, parallely learning the reward function:

$$w^{(p)} = \arg \max_w \min \sum_{j=1}^N w^T (\mu_j(\pi^{(p-1)}) - \mu_{E,j}(\pi^{(p-1)})),$$

- IRL phase, parallely updating policy function parameters :

$$\pi^{(p)} = \arg \max_{\pi} \sum_{j=1}^N E[V_j^{\pi}(s_t)] |_{\tilde{R}^{(p)}(s,a)=w^{(p)} \cdot \phi(s)},$$

- Multiple agents feature updating :

$$\forall j, \mu_j^{(p)} = \mu_j(\pi^{(p)}).$$

Parallelized apprenticeship learning strategy:

- Simultaneously maintaining the statuses of all tracking objects on the training set;
- Updating the reward function parameters with all the objects on the training video , so that the convergence speed is faster;
- Resuming the training from the last failure point for an agent. O(n) training time complexity for a video with  $n$  frames and  $k$  objects (polling variant of AL: O( $n*k$ )).

---

**Algorithm 1** Parallelized apprenticeship learning for *lost* state with backward tracklets utilization.

---

**Input:** Video sequences  $V = \{v_i\}_{i=1}^N$ , ground truth trajectories  $O_i = \{o_{i,j}\}_{j=1}^{N_i}$  and object detections  $D_i = \{d_j^i\}_{j=1}^{N_i}$ ;

**Output:** reward function parameters  $(w_{lost}, b_{lost})$  for lost status data association;

- 1: Initialization of reward function:  $w_{lost}^0 \leftarrow w_0, b_{lost}^0 \leftarrow b_0, S \leftarrow \emptyset$
- 2: Initialization for each target  $o_{i,j}$  in each  $v_i$ : set MDP of  $o_{i,j}$  in *tracked* after  $t_{start}(i,j) \leftarrow$  index of the first frame where  $o_{i,j}$  correctly detected
- 3:  $p \leftarrow 0$
- 4: **repeat**
- 5:      $p \leftarrow p + 1$
- 6:     **for** each video  $v_i$  in  $V$  **do**
- 7:          $t \leftarrow 1$
- 8:         **while**  $t \leq$  last frame of  $v_i$  **do**
- 9:             **for** target  $o_{i,j}$  in  $v_i$  which  $t_{start}(i,j) \geq t$  **do**
- 10:                 Follow policy  $\pi^{p-1}$ , compute  $\mu_{i,j}^{\pi}$  as Eq.6, choose action  $a$
- 11:                 Compute ground truth action:  $a_{gt}$
- 12:                 **if** state is *lost* and  $a \neq a_{gt}$  **then**
- 13:                      $S \leftarrow S \cup \{\phi(o_{i,j}^t, d_k^t), y_k\}$

- 25: **until** all targets are successfully tracked.

---

# Experiment evaluation

Welcome to the Multiple Object Tracking Benchmark!

In the recent past, the computer vision community has relied on several centralized benchmarks for performance evaluation of numerous tasks including object detection, pedestrian detection, 3D reconstruction, optical flow, single-object short-term tracking, and stereo estimation. Despite potential pitfalls of such benchmarks, they have proved to be extremely helpful to advance the state-of-the-art in the respective research fields. Interestingly, there has been rather limited work on the standardization of multiple target tracking evaluation. One of the few exceptions is the well-known [PETS](#) dataset, targeted primarily at surveillance applications. Even for this widely used benchmark, a common technique for presenting tracking results to date involves using different subsets of the available data, inconsistent model training and varying evaluation scripts.

With this benchmark we would like to pave the way for a unified framework towards more meaningful quantification of multi-target tracking.

- 22 video sequences (11 for training and 11 for testing);
- overall contains 61440 object detections generated by the ACF detector;
- over 10 minutes tracking data annotations;
- having lots of variations in camera perspective, shaking and weather conditions, etc.;
- The evaluation results on test set must be obtained via the official evaluation server.

The MOT Challenge 2015 Multiple object tracking benchmark\*

\*<https://motchallenge.net/>

# Experiment evaluation

- The CLEAR metric for multiple object tracking evaluation:

- Multiple Object Tracking Accuracy (MOTA, the higher the better)

$$MOTA = 1 - \frac{\sum_t (FN_t + FP_t + IDS_t)}{\sum_t GT_t}$$

- Multiple Object Tracking Precision (MOTP, evaluating object detector performance, the higher the better)

$$MOTP = \frac{\sum_{t,i} d_{t,i}}{\sum_t c_t}$$

- Mostly Tracked trajectories (MT, the higher the better)
- Partially Tracked trajectories (PT)
- Mostly Lost trajectories (ML, the lower the better)
- Tracklet ID Switches (IDS, the lower the better)
