

10733 - Representation and generation in Neuroscience and AI

Spring 2024, Syllabus

January 17, 2024

Instructor Leila Wehbe, lwehbe@cmu.edu, office hours by appointment or right after class.

TAs Joel Ye, joelye@andrew.cmu.edu and Lane Lewis lrlewis@andrew.cmu.edu.

Day, time, location: Mondays and Wednesdays at 3:30pm-4:50pm, GHC 4102.

This course is aimed to help students with a neuroscience background as well as those with a computational background to form a solid basis in Computational Cognitive Neuroscience research. The focus will be on acquiring the skills to both build models of brain activity and understand the implications of these models.

This PhD-level course explores the intersection of Neuroscience and AI. It evaluates the use of new AI methods as models for the brain, and the utility of inspirations from the brain for building better AI. The course has two main components: (a) a critical look at the current practice of computational neuroscience through lectures, readings and discussions and (b) an active, practical component (through homework and projects) that allows students to form their opinions based not only on readings and ideas imposed upon them, but also through their own experience and understanding. Specifically, the class has a project component, which is expected to be substantial enough that the work could lead to a publication if successful.

The focus of the class will be on representations in the brain and in AI models, specifically in the areas of language and vision (and their intersection). Students will learn the most recent approaches for using AI models as models of the brain, along with the arguments for and against these types of approaches. The course will also touch upon generation in both AI models and in the brain, and discuss possibilities of integrating them.

Key Topics: NeuroAI, encoding models, fMRI, MEG, invasive recordings, language, vision, NLP, computer vision.

Learning Objectives: The aim of this class is to enable students to:

- know the state of the art in modeling brain responses using AI and key findings,
- identify key fallacies in modeling and ways to avoid them,
- form computational cognitive neuroscience research questions and a plan to address them,
- have practical experience in modeling brain responses.

Prerequisites Intermediate Statistics and/or machine learning, working knowledge of AI models, basic knowledge in cognitive neuroscience. For students who do not have the cognitive neuroscience background, readings will be provided to be covered at the beginning of the semester. The official requirement is having taken one of the machine learning classes (10301 or 10315 or 10601 or 10701 or 10715 or 10707 or 10417 or 10617 or 10414 or 10714). If you believe you have the necessary background from other coursework, please contact the instructor.

Credits and assessment structure The course is a 12 unit class. The graded components are as follows: (these percentages might change a bit before the start of the Spring semester)

- 20% reading and participation. Each week, a paper will be assigned and the class will begin with a short quiz on that paper (the 10 best scores will be counted towards the grade). Further, participation will be a large part of the grade.

- 10% students will be asked to scribe two lectures.
- 20% homework assignments.
- 50% class project. The project is expected to target a new scientific problem or target an existing problem in a new way. Success in evaluating the project hypothesis is not necessary for a good project. The final deliverable will be a NeurIPS style paper and a class presentation.

Schedule/topics

- Week 1: Intro to Neuroscience - Big Questions - levels of analysis - Data types
- Week 2: Methods - GLM - RSA - encoding models - decoding - statistical tests
- Week 3: Language: fast overview of existing work - interpretable feature spaces
- Week 4: Language: Using deep language models
- Week 5: Language: Interpreting encoding models
- Week 6: Vision: fast overview of existing work - interpretable models
- Week 7: Vision: using CNNs to model the visual system
- Week 8: Vision: end-to-end modeling and significance.
- Week 9: Other modalities - audition - RL - memory / events
- Week 10: Perception vs. production / generation
- Week 11: Decoding - BCI
- Week 12: Epistemology - what is this for?
- Week 13: Extra topics
- Week 14: Project presentations

Some of the papers we will study

- Mitchell, T.M., Shinkareva, S.V., Carlson, A., Chang, K.M., Malave, V.L., Mason, R.A. and Just, M.A., 2008. Predicting human brain activity associated with the meanings of nouns. *science*, 320(5880), pp.1191-1195.
- Nishimoto, S., Vu, A.T., Naselaris, T., Benjamini, Y., Yu, B. and Gallant, J.L., 2011. Reconstructing visual experiences from brain activity evoked by natural movies. *Current biology*, 21(19), pp.1641-1646.
- Wang, J., Miller, K., Marblestone, A., 2020, Where Neuroscience meets AI (And What's in Store for the Future), *Neurips Tutorial 2020*.

Course policies

Attendance This course is a discussion-based course and therefore attendance is essential for benefiting from it and contributing to it. Attendance will not be directly graded but participation will. We understand that some events such as conferences will lead to absence. Please communicate your absence in advance to the course staff. There will be some allowance in the grade for a few absences.

Collaboration Discussion of class material is heavily encouraged. Collaboration in homework assignments is allowed as long as it's properly reported. Project collaboration is expected (projects are done in groups), and is allowed across groups as well.

Academic Integrity We have a zero tolerance policy for violation of class policies. If you are in any doubt in regards to the policy, please clarify with the course staff before proceeding.

- Any deviation from the rules will be dealt with according to the severity of the case. For example: plagiarising content or taking help from someone without acknowledging their contribution on the paper.
- In line with university policy, all instances of cheating/plagiarism will be reported to your academic advisor and the dean of student affairs. See the university policy on academic integrity.

Late Assignments The maximum earnable points for each assignment will drop by 20% per late day.

Additional information

Accommodations for Students with Disabilities

If you have a disability and are registered with the Office of Disability Resources, I encourage you to use their online system to notify me of your accommodations and discuss your needs with me as early in the semester as possible. I will work with you to ensure that accommodations are provided as appropriate. If you suspect that you may have a disability and would benefit from accommodations but are not yet registered with the Office of Disability Resources, I encourage you to contact them at access@andrew.cmu.edu.

Statement of Support for Students' Health & Well-being

Take care of yourself. Do your best to maintain a healthy lifestyle this semester by eating well, exercising, avoiding drugs and alcohol, getting enough sleep and taking some time to relax. This will help you achieve your goals and cope with stress.

If you or anyone you know experiences any academic stress, difficult life events, or feelings like anxiety or depression, we strongly encourage you to seek support. Counseling and Psychological Services (CaPS) is here to help: call 412-268-2922 and visit <http://www.cmu.edu/counseling/>. Consider reaching out to a friend, faculty or family member you trust for help getting connected to the support that can help.

If you or someone you know is feeling suicidal or in danger of self-harm, call someone immediately, day or night (CaPS: 412-268-2922, Resolve Crisis Network: 888-796-8226). If the situation is life threatening, call the police (On-campus CMU Police: 412-268-2323, Off-campus Police: 911).
