

# 10-301/601 Introduction to Machine Learning

Machine Learning Department  
School of Computer Science  
Carnegie Mellon University

# Course Overview

Matt Gormley & Henry Chai  
Lecture 1  
Aug. 30, 2021

# **WHAT IS MACHINE LEARNING?**

# Artificial Intelligence

The basic goal of AI is to develop intelligent machines.

This consists of many sub-goals:

- Perception
- Reasoning
- Control / Motion / Manipulation
- Planning
- Communication
- Creativity
- Learning

# What is Machine Learning?

The goal of this course is to provide you with a toolbox:

Machine Learning

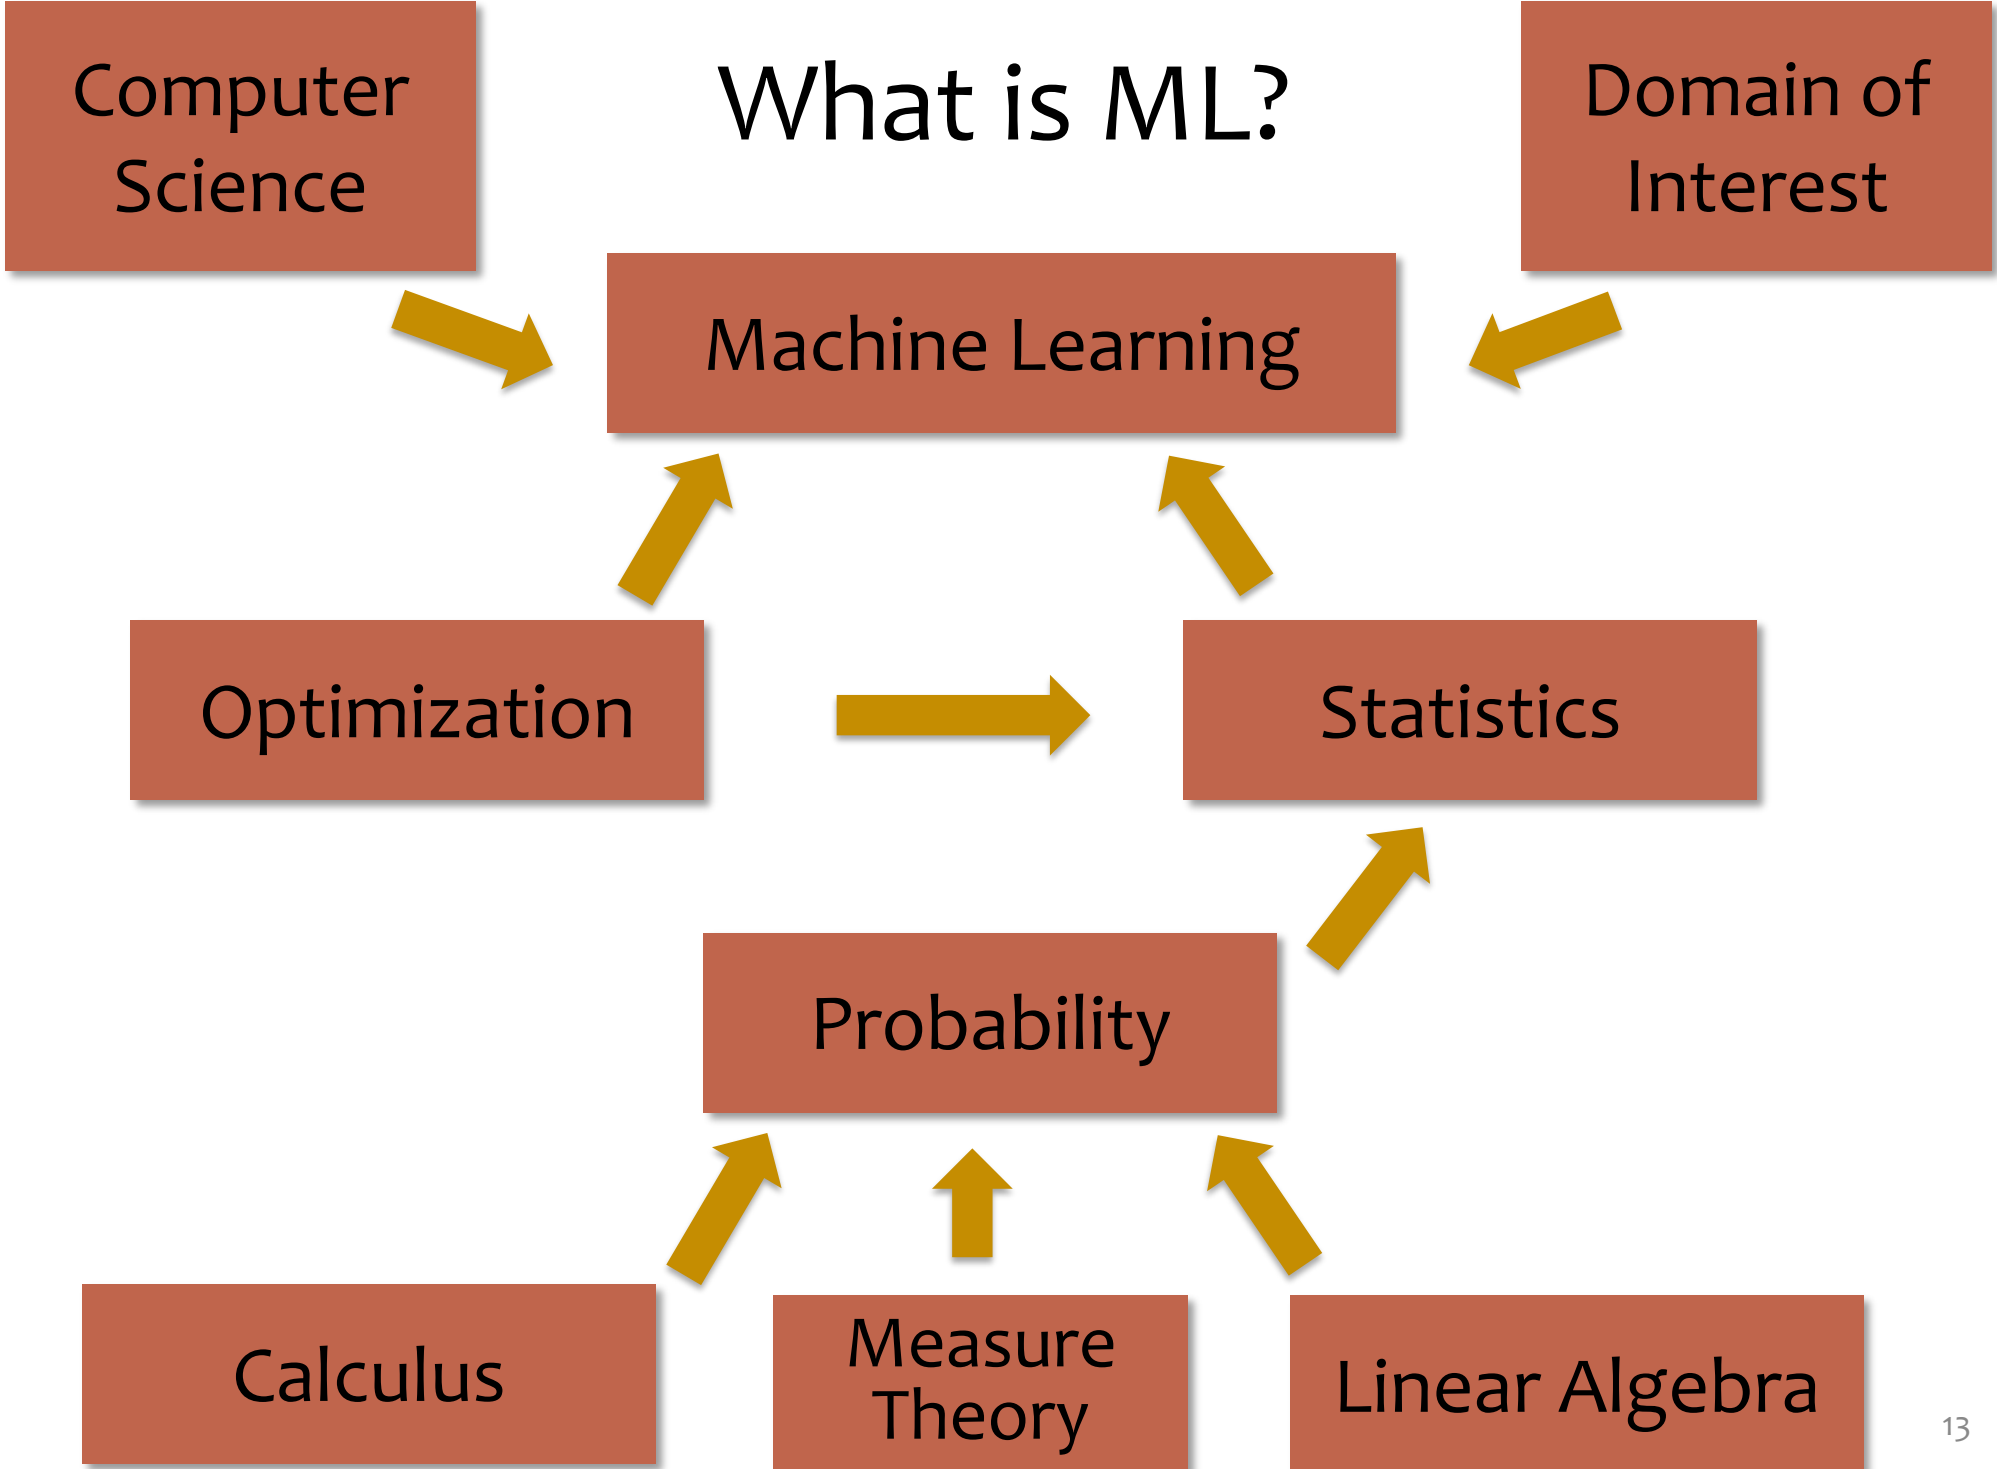

Statistics

Probability

Computer Science

Optimization

# What is ML?

## Speech Recognition

### 1. Learning to recognize spoken words

THEN

"...the SPHINX system (e.g. Lee 1989) learns speaker-specific strategies for recognizing the primitive sounds (phonemes) and words from the observed speech signal...neural network methods...hidden Markov models..."

NOW

Source: <https://www.stonetemple.com/great-knowledge-box-showdown/#VoiceStudyResults>

(Mitchell, 1997)

## Robotics

### 2. Learning to drive an autonomous vehicle

THEN

"...the ALVINN system (Pomerleau 1989) has used its learned strategies to drive unassisted at 70 miles per hour for 90 miles on public highways among other cars..."

NOW

waymo.com

(Mitchell, 1997)

## Games / Reasoning

### 3. Learning to beat the masters at board games

THEN

"...the world's top computer program for backgammon, TD-GAMMON (Tesauro, 1992, 1995), learned its strategy by playing over one million practice games against itself..."

NOW

(Mitchell, 1997)

## Computer Vision

### 4. Learning to recognize images

THEN

"...The recognizer is a convolution network that can be spatially replicated. From the network output, a hidden Markov model produces word scores. The entire system is globally trained to minimize word-level errors..."

(LeCun et al., 1995)

NOW

## Learning Theory

### 5. In what cases and how well can we learn?

#### Sample Complexity Results

Definition 4.1. The sample complexity of a learning algorithm is the number of examples required to achieve arbitrarily small error (with respect to the optimal hypothesis) with high probability (i.e. close to 1).

Four Cases we care about...

Flattor (K)	Realizable	Agnostic
Finite (K)	$n = \frac{1}{\epsilon} \log \frac{1}{\delta} \log \frac{1}{\epsilon}$	$n = \frac{1}{\epsilon^2} \log \frac{1}{\delta} \log \frac{1}{\epsilon}$
Infinite (K)	$n = \frac{1}{\epsilon^2} \log \frac{1}{\delta} \log \frac{1}{\epsilon}$	$n = \frac{1}{\epsilon^2} \log \frac{1}{\delta} \log \frac{1}{\epsilon}$

For  $\epsilon \in (0, 1]$  and  $\delta \in (0, 1]$

① The Error (aka expected risk) (aka Generalization Error)

$$R(\hat{h}) = \mathbb{P}_{\mathcal{D}^n} (R(\hat{h}) \neq R(h^*))$$

② The Error (aka expected risk)

$$R(\hat{h}) = \mathbb{P}_{\mathcal{D}^n} (R(\hat{h}) \neq R(h^*))$$

$S = \{x^1, \dots, x^m\}$

$$R(\hat{h}) = \frac{1}{m} \sum_{i=1}^m \mathbb{1}(h(x^i) \neq y(x^i))$$

$R(h) = \mathbb{P} (y \neq h(x))$

PK Learning

Can we learn  $R(\hat{h})$  in terms of  $R(h)$ ?

PK:  $R(\hat{h}) \leq R(h) + \epsilon$  (with high probability)

PK:  $R(\hat{h}) \leq R(h) + \epsilon$  (with high probability)

PK:  $R(\hat{h}) \leq R(h) + \epsilon$  (with high probability)

1. How many examples do we need to learn?
2. How do we quantify our ability to generalize to unseen data?
3. Which algorithms are better suited to specific learning settings?

# Learning Theory

## • 5. In what cases and how well can we learn?

### Sample Complexity Results

**Definition 0.1.** The **sample complexity** of a learning algorithm is the number of examples required to achieve arbitrarily small error (with respect to the optimal hypothesis) with high probability (i.e. close to 1).

Four Cases we care about...

	Realizable	Agnostic
Finite $ \mathcal{H} $	$N \geq \frac{1}{\epsilon} [\log( \mathcal{H} ) + \log(\frac{1}{\delta})]$ labeled examples are sufficient so that with probability $(1 - \delta)$ all $h \in \mathcal{H}$ with $R(h) \geq \epsilon$ have $\hat{R}(h) > 0$ .	$N \geq \frac{1}{2\epsilon^2} [\log( \mathcal{H} ) + \log(\frac{2}{\delta})]$ labeled examples are sufficient so that with probability $(1 - \delta)$ for all $h \in \mathcal{H}$ we have that $ R(h) - \hat{R}(h)  < \epsilon$ .
Infinite $ \mathcal{H} $	$N = O(\frac{1}{\epsilon} [\text{VC}(\mathcal{H}) \log(\frac{1}{\epsilon}) + \log(\frac{1}{\delta})])$ labeled examples are sufficient so that with probability $(1 - \delta)$ all $h \in \mathcal{H}$ with $R(h) \geq \epsilon$ have $\hat{R}(h) > 0$ .	$N = O(\frac{1}{\epsilon^2} [\text{VC}(\mathcal{H}) + \log(\frac{1}{\delta})])$ labeled examples are sufficient so that with probability $(1 - \delta)$ for all $h \in \mathcal{H}$ we have that $ R(h) - \hat{R}(h)  \leq \epsilon$ .

### Two Types of Error

① True Error (aka. expected risk) (aka. Generalization Error)

$$R(h) = \mathbb{P}_{x \sim p^*(x)} (c^*(x) \neq h(x)) \quad \leftarrow \text{always unknown.}$$

② Train Error (aka. empirical risk)

$$\begin{aligned} \hat{R}(h) &= \mathbb{P}_{x \sim S} (c^*(x) \neq h(x)) \quad \leftarrow S = \{x^{(1)}, \dots, x^{(N)}\} \\ &= \frac{1}{N} \sum_{i=1}^N \mathbb{I}(c^*(x^{(i)}) \neq h(x^{(i)})) \quad \leftarrow \text{known, computable} \\ &= \frac{1}{N} \sum_{i=1}^N \mathbb{I}(y^{(i)} \neq h(x^{(i)})) \end{aligned}$$

### PAC Learning

Q: Can we bound  $R(h)$  in terms of  $\hat{R}(h)$ ?  
A: Yes!

PAC stands for Probably Approximately Correct

PAC learner yields hypothesis  $h$ , which is approximately correct  $R(h) \approx 0$   
with high probability  $\Pr(R(h) \approx 0) \approx 1$

Def: PAC Criterion

$$\Pr(\forall h, |R(h) - \hat{R}(h)| \leq \epsilon) \geq 1 - \delta$$

1. How many examples do we need to learn?
2. How do we quantify our ability to generalize to unseen data?
3. Which algorithms are better suited to specific learning settings?

## Learning Theory

### 5. In what cases and how well can we learn?

#### Sample Complexity Results

Definition 4.1. The sample complexity of a learning algorithm is the number of examples required to achieve arbitrarily small error (with respect to the optimal hypothesis) with high probability (i.e. close to 1).

Four Cases we care about...

Finite (K):  $K$  is the number of hypotheses in the hypothesis set.  $n \geq \frac{1}{\epsilon} \ln \frac{1}{\delta}$  is sufficient to learn with probability  $1 - \delta$  and error at most  $\epsilon$ .

Infinite (K):  $n \geq \frac{1}{\epsilon} \ln \frac{1}{\delta}$  is sufficient to learn with probability  $1 - \delta$  and error at most  $\epsilon$ .

Two types of error:  $R(\hat{h}) - R(h^*)$  (empirical error) and  $R(h^*) - R(h)$  (generalization error).  $R(\hat{h}) = \frac{1}{n} \sum_{i=1}^n \ell(h(x_i), y_i)$  and  $R(h) = \int \ell(h(x), y) dP(x, y)$ .  $R(\hat{h}) - R(h^*) \leq \frac{1}{n} \sum_{i=1}^n \ell(h^*(x_i), y_i) - \int \ell(h^*(x), y) dP(x, y) + R(h^*) - R(h)$ . The first term is  $O(\frac{1}{\sqrt{n}})$  and the second term is  $O(\frac{1}{\sqrt{n}}$ ).

PK Lemma: Can we learn  $R(h)$  in terms of  $R(\hat{h})$ ? PK shows that  $R(h)$  is approximately correct if  $R(\hat{h}) \leq \epsilon$  and  $R(\hat{h}) - R(h) \leq \epsilon$ .  $R(h) - R(\hat{h}) \leq \epsilon$  is true if  $n \geq \frac{1}{\epsilon^2} \ln \frac{1}{\delta}$ .

- How many examples do we need to learn?
- How do we quantify our ability to generalize to unseen data?
- Which algorithms are better suited to specific learning settings?

# What is Machine Learning?

The goal of this course is to provide you with a toolbox:

Machine Learning

Statistics

Probability

Computer Science

Optimization

To solve all the problems above and more

# Societal Impacts of ML

*What ethical responsibilities do we have as machine learning experts?*

**Question:** What are the possible societal impacts of machine learning for each case below?

## Answer:

1) Search results for news are optimized for ad revenue.

<http://bing.com/>

<http://arstechnica.com/>

2) An autonomous vehicle is permitted to drive unassisted on the road.

3) A doctor is prompted by an intelligent system with a plausible diagnosis for her patient.

<https://flic.kr/p/HNJUZV>

# Topics

- Foundations
  - Probability
  - MLE, MAP
  - Optimization
- Classifiers
  - KNN
  - Naïve Bayes
  - Logistic Regression
  - Perceptron
  - SVM
- Regression
  - Linear Regression
- Important Concepts
  - Kernels
  - Regularization and Overfitting
  - Experimental Design
- Unsupervised Learning
  - K-means / Lloyd's method
  - PCA
  - EM / GMMs
- Neural Networks
  - Feedforward Neural Nets
  - Basic architectures
  - Backpropagation
  - CNNs, LSTMs
- Graphical Models
  - Bayesian Networks
  - HMMs
  - Learning and Inference
- Learning Theory
  - Statistical Estimation (covered right before midterm)
  - PAC Learning
- Other Learning Paradigms
  - Matrix Factorization
  - Reinforcement Learning
  - Information Theory

# ML Big Picture

## Learning Paradigms:

*What data is available and when? What form of prediction?*

- supervised learning
- unsupervised learning
- semi-supervised learning
- reinforcement learning
- active learning
- imitation learning
- domain adaptation
- online learning
- density estimation
- recommender systems
- feature learning
- manifold learning
- dimensionality reduction
- ensemble learning
- distant supervision
- hyperparameter optimization

## Theoretical Foundations:

*What principles guide learning?*

- probabilistic
- information theoretic
- evolutionary search
- ML as optimization

## Problem Formulation:

*What is the structure of our output prediction?*

boolean	Binary Classification
categorical	Multiclass Classification
ordinal	Ordinal Classification
real	Regression
ordering	Ranking
multiple discrete	Structured Prediction
multiple continuous	(e.g. dynamical systems)
both discrete & cont.	(e.g. mixed graphical models)

## Facets of Building ML Systems:

*How to build systems that are robust, efficient, adaptive, effective?*

1. Data prep
2. Model selection
3. Training (optimization / search)
4. Hyperparameter tuning on validation data
5. (Blind) Assessment on test data

## Big Ideas in ML:

*Which are the ideas driving development of the field?*

- inductive bias
- generalization / overfitting
- bias-variance decomposition
- generative vs. discriminative
- deep nets, graphical models
- PAC learning
- distant rewards

## Application Areas

*Key challenges?*

NLP, Speech, Computer Vision, Robotics, Medicine, Search

# **DEFINING LEARNING PROBLEMS**

# Well-Posed Learning Problems

## Three components $\langle T, P, E \rangle$ :

1. Task,  $T$
2. Performance measure,  $P$
3. Experience,  $E$

## Definition of learning:

A computer program **learns** if its performance at task  $T$ , as measured by  $P$ , improves with experience  $E$ .

# Example Learning Problems

## Learning to beat the masters at **chess**

1. Task,  $T$ :
2. Performance measure,  $P$ :
3. Experience,  $E$ :

# Example Learning Problems

## Learning to **respond to voice commands (Siri)**

1. Task,  $T$ :
2. Performance measure,  $P$ :
3. Experience,  $E$ :

# Capturing the Knowledge of Experts

## Solution #1: Expert Systems

- Over 20 years ago, we had rule-based systems:
  1. Put a bunch of linguists in a room
  2. Have them think about the structure of their native language and write down the rules they devise

Give me directions to Starbucks

If: "give me directions to X"  
Then: `directions(here, nearest(X))`

How do I get to Starbucks?

If: "how do i get to X"  
Then: `directions(here, nearest(X))`

Where is the nearest Starbucks?

If: "where is the nearest X"  
Then: `directions(here, nearest(X))`

# Capturing the Knowledge of Experts

## Solution #1: Expert Systems

- Over 20 years ago, we had rule-based systems:
  1. Put a bunch of linguists in a room
  2. Have them think about the structure of their native language and write down the rules they devise

I need directions to Starbucks

If: "I need directions to X"  
Then: directions(here, nearest(X))

Starbucks directions

If: "X directions"  
Then: directions(here, nearest(X))

Is there a Starbucks nearby?

If: "Is there an X nearby"  
Then: directions(here, nearest(X))

# Capturing the Knowledge of Experts

## Solution #2: Annotate Data and Learn

- Experts:
  - **Very good** at answering questions about specific cases
  - **Not very good** at telling **HOW** they do it
- 1990s: So why not just have them tell you what they do on **SPECIFIC CASES** and then let **MACHINE LEARNING** tell you how to come to the same decisions that they did

# Capturing the Knowledge of Experts

## Solution #2: Annotate Data and Learn

1. Collect raw sentences  $\{x^{(1)}, \dots, x^{(n)}\}$
2. Experts annotate their meaning  $\{y^{(1)}, \dots, y^{(n)}\}$

$x^{(1)}$ : How do I get to Starbucks?

$y^{(1)}$ : `directions(here, nearest(Starbucks))`

$x^{(2)}$ : Show me the closest Starbucks

$y^{(2)}$ : `map(nearest(Starbucks))`

$x^{(3)}$ : Send a text to John that I'll be late

$y^{(3)}$ : `txtmsg(John, I'll be late)`

$x^{(4)}$ : Set an alarm for seven in the morning

$y^{(4)}$ : `setalarm(7:00AM)`

# Example Learning Problems

## Learning to **respond to voice commands (Siri)**

1. Task,  $T$ :

**predicting action from speech**

2. Performance measure,  $P$ :

**percent of correct actions taken in user pilot study**

3. Experience,  $E$ :

**examples of (speech, action) pairs**

# Problem Formulation

- Often, the same task can be formulated in more than one way:
- Ex: Loan applications
  - creditworthiness/score (regression)
  - probability of default (density estimation)
  - loan decision (classification)

## **Problem Formulation:**

*What is the structure of our output prediction?*

boolean	Binary Classification
categorical	Multiclass Classification
ordinal	Ordinal Classification
real	Regression
ordering	Ranking
multiple discrete	Structured Prediction
multiple continuous	(e.g. dynamical systems)
both discrete & cont.	(e.g. mixed graphical models)

# Well-posed Learning Problems

## In-Class Exercise

1. Select a **task, T**
2. Identify **performance measure, P**
3. Identify **experience, E**
4. Report ideas back to rest of class

## Example Tasks

- Identify objects in an image
- Translate from one human language to another
- Recognize speech
- Assess risk (e.g. in loan application)
- Make decisions (e.g. in loan application)
- Assess potential (e.g. in admission decisions)
- Categorize a complex situation (e.g. medical diagnosis)
- Predict outcome (e.g. medical prognosis, stock prices, inflation, temperature)
- Predict events (default on loans, quitting school, war)
- Plan ahead under perfect knowledge (chess)
- Plan ahead under partial knowledge (poker, bridge)

# **SYLLABUS HIGHLIGHTS**

# Syllabus Highlights

The syllabus is located on the course webpage:

<http://www.cs.cmu.edu/~mgormley/courses/10601>

or

<http://mlcourse.org>

The **course policies** are **required** reading.

# Syllabus Highlights

- **Grading:** 50% homework, 15% exam 1, 15% exam 2, 15% exam 3, 5% participation
- **Exam 1:** evening exam, Thu, Sep. 30
- **Exam 2:** evening exam, Tue, Nov. 02
- **Exam 3:** final exam week, date TBD by registrar
- **Homework:** ~3 written and ~6 written + programming
  - 6 grace days for homework assignments
  - Late submissions: 75% day 1, 50% day 2, 25% day 3
  - No submissions accepted after 3 days w/o extension
  - Extension requests: see syllabus
- **Recitations:** Fridays, same time/place as lecture (optional, interactive sessions)
- **Readings:** required, online PDFs, recommended for after lecture
- **Technologies:** Piazza (discussion), Gradescope (homework), Google Forms (polls)
- **Academic Integrity:**
  - Collaboration encouraged, but must be documented
  - Solutions must always be written independently
  - No re-use of found code / past assignments
  - Severe penalties (i.e.. failure)
- **Office Hours:** posted on Google Calendar on “Office Hours” page

# Lectures

- You should ask lots of questions
  - Interrupting (by raising a hand) to ask your question is strongly encouraged
  - Asking questions later (or in real time) on Piazza is also great
- When I ask a question...
  - I want you to answer
  - Even if you don't answer, think it through as though I'm about to call on you
- Interaction improves learning (both in-class and at my office hours)

# Textbooks

You are not *required* to read a textbook, but it will help immensely!

# Where can I find...?

[Handout](#)
- Homework 6: Neural Networks and Reinforcement Learning (written / programming)  
[Handout](#)
- Homework 7: Graphical Models (written / programming)

# In-Class Polls

**Q:** How do these In-Class Polls work?

**A:** Don't worry about it for today. We won't use them until the second week of class, i.e. the third lecture.

Details are on the syllabus.

# PREREQUISITES

# Prerequisites

## What they are:

- Significant programming experience (15-122)
  - Written programs of 100s of lines of code
  - Comfortable learning a new language
- Probability and statistics (36-217, 36-225, etc.)
- Mathematical maturity: discrete mathematics (21-127, 15-151), linear algebra, and calculus

# Prerequisites

## What if you need additional review?

- Consider first taking 10-606/607: Mathematical/Computational Foundations for Machine Learning
- More details here:  
<https://www.cs.cmu.edu/~pvirtue/10606/>

## How to describe 606/607 to a friend

606/607 is...

a **formal** presentation of **mathematics** and **computer science**...

motivated by (carefully chosen) **real-world problems** that arise in **machine learning**...

where the **broader picture** of how those problems arise is treated **somewhat informally**.

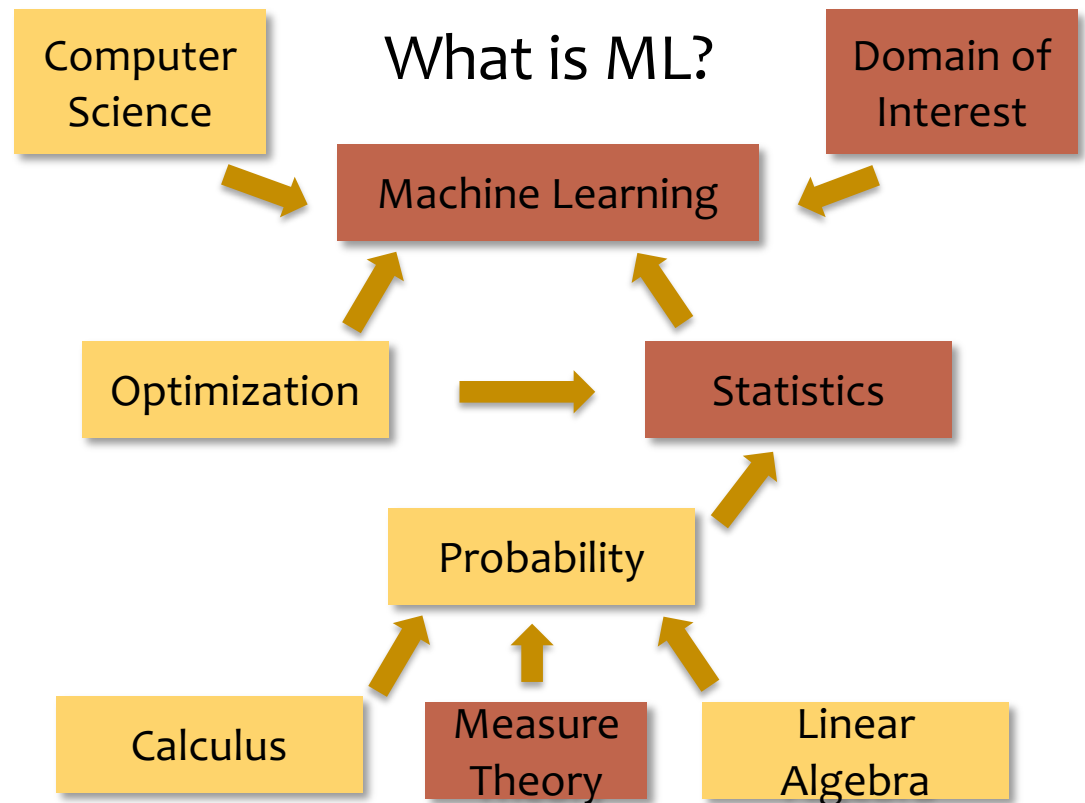

# Prerequisites

## What if you need additional review?

- Consider first taking 10-606/607: Mathematical/Computational Foundations for Machine Learning
- More details here:

<https://www.cs.cmu.edu/~pvirtue/10606/>

Oh, the Places  
You'll  
Use Probability!

By  
Dr. Seuss

# Oh, the Places You'll Use Probability!

## Supervised Classification

- Naïve Bayes

$$p(y|x_1, x_2, \dots, x_n) = \frac{1}{Z} p(y) \prod_{i=1}^n p(x_i|y)$$

- Logistic regression

$$\begin{aligned} P(Y = y|X = x; \boldsymbol{\theta}) &= p(y|x; \boldsymbol{\theta}) \\ &= \frac{\exp(\boldsymbol{\theta}_y \cdot \mathbf{f}(x))}{\sum_{y'} \exp(\boldsymbol{\theta}_{y'} \cdot \mathbf{f}(x))} \end{aligned}$$

Note: This is just motivation – we'll cover these topics later!

# Oh, the Places You'll Use Probability!

## ML Theory

### (Example: Sample Complexity)

- Goal:  $h$  has small error over  $D$ .

$$\text{True error: } err_D(h) = \Pr_{x \sim D} (h(x) \neq c^*(x))$$

How often  $h(x) \neq c^*(x)$  over future instances drawn at random from  $D$

- But, can only measure:

$$\text{Training error: } err_S(h) = \frac{1}{m} \sum_i I(h(x_i) \neq c^*(x_i))$$

How often  $h(x) \neq c^*(x)$  over training instances

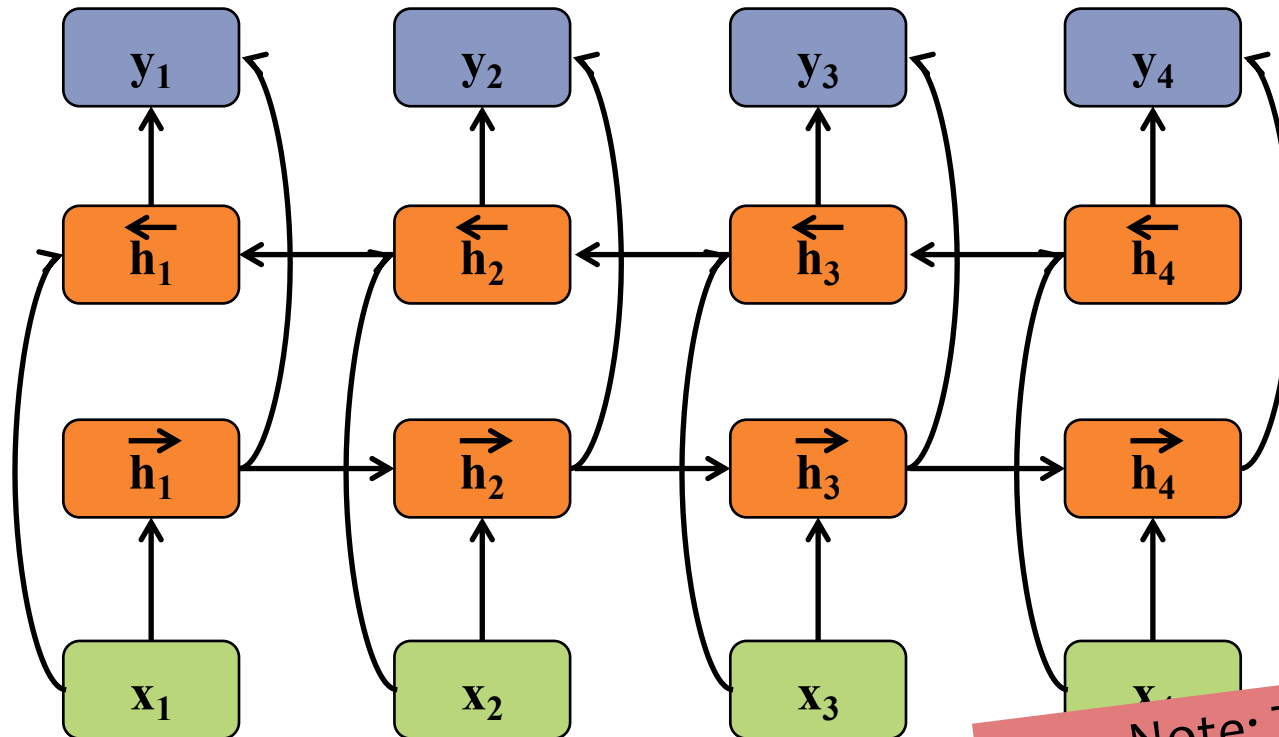

**Sample complexity: bound  $err_D(h)$  in terms of  $err_S(h)$**

Note: This is just motivation – we'll cover these topics later!

# Oh, the Places You'll Use Probability!

## Deep Learning

(Example: Deep Bi-directional RNN)

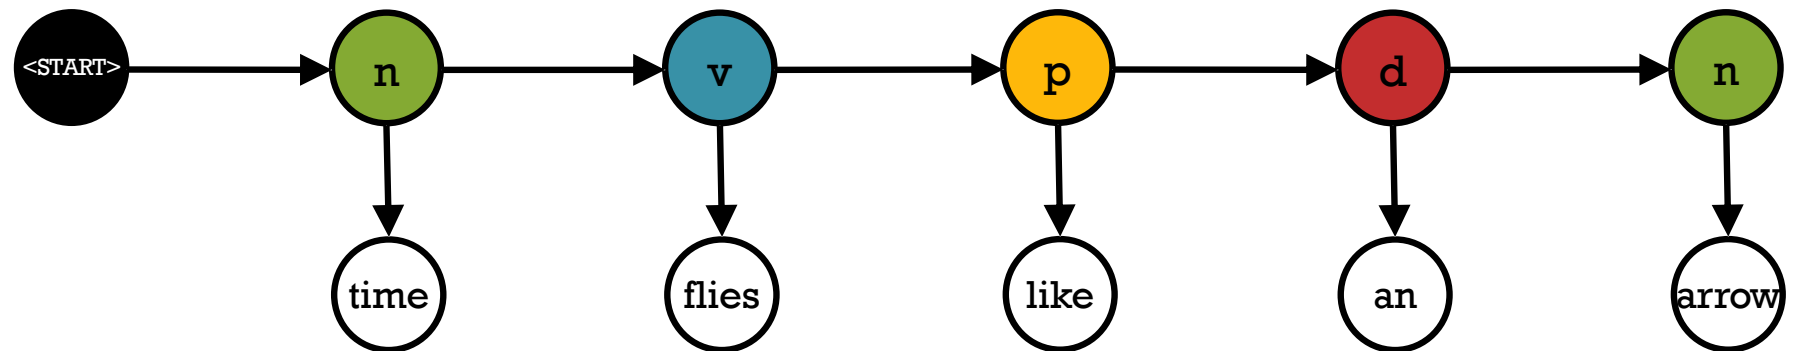

Note: This is just motivation – we'll cover these topics later!

# Oh, the Places You'll Use Probability!

## Graphical Models

- Hidden Markov Model (HMM)

- Conditional Random Field (CRF)

Note: This is just motivation – we'll cover these topics later!

# Prerequisites

## **What if I'm not sure whether I meet them?**

- Don't worry: we're not sure either
- However, we've designed a way to assess your background knowledge so that you know what to study!

(see instructions of written portion of HW1)

# Reminders

- **Homework 1: Background**
  - **Out: Wed, Sep 1 (2nd lecture)**
  - **Due: Wed, Sep 8 at 11:59pm**
  - **Two parts:**
    1. **written part to Gradescope**
    2. **programming part to Gradescope**
  - **unique policy for this assignment:**
    1. **two submissions** for written (see writeup for details)
    2. **unlimited submissions** for programming (i.e. keep submitting until you get 100%)

# Learning Objectives

*You should be able to...*

1. Formulate a well-posed learning problem for a real-world task by identifying the task, performance measure, and training experience
2. Describe common learning paradigms in terms of the type of data available, when it's available, the form of prediction, and the structure of the output prediction
3. Implement Decision Tree training and prediction (w/simple scoring function)
4. Explain the difference between memorization and generalization [CIML]
5. Identify examples of the ethical responsibilities of an ML expert

Q&A
