# 15-319 / 15-619 Cloud Computing

Recitation 5 September 29<sup>th</sup>, 2020

### **Reflection of Last Week**

- Conceptual content on OLI
  - Modules 5, 6 and Quiz 3
- Project theme Horizontal Scaling and Advanced Resource
   Scaling
  - AWS Horizontal Scaling
    - Launch cloud resources via the AWS APIs (EC2)
    - Horizontally scale instances to reach a target RPS
  - AWS Autoscaling
    - Launch cloud resources via the AWS APIs (ALB / ASG...)
    - Design autoscaling policies to achieve RPS targets within instance hour limits
    - Handle instance failures
  - AWS Autoscaling with Terraform
    - Develop a Terraform template to launch cloud resources
    - Contrast infrastructure as code (IaC) and cloud APIs

#### **This Week**

- Code Review Project 1.2
  - Due on Wednesday, Sept 30th, 2020, 11:59PM ET
- Quiz 4 (OLI Modules 7, 8 & 9)
  - Due on Friday, Oct 2nd, 2020, 11:59PM ET
- Practice OPE signup via Piazza link
  - Due on Saturday, Oct 11th, 2020, 11:59PM ET
- Project 2.2
  - Due on <u>Sunday</u>, Oct 4th, 2020, 11:59PM ET

#### • Primers released this week

- Introduction to Cloud Functions
- MongoDB Primer
- MySQL Primer
- NoSQL Primer
- Profiling a Cloud Service
- Python Version Management and VSCode for Azure Functions
- Storage I/O benchmarking

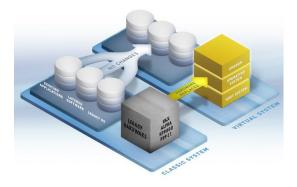

# This Week: Conceptual Content

- OLI, UNIT 3: Cloud Infrastructure
  - Module 7: Introduction and Motivation
  - Module 8: Virtualization
  - Module 9: Resource Virtualization CPU
  - Module 10: Resource Virtualization Memory
  - Module 11: Resource Virtualization I/O
  - Module 12: Case Study
  - Module 13: Storage and Network Virtualization

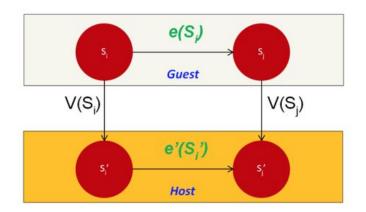

OLI Module 7 - Virtualization Introduction and Motivation

- Why virtualization?
  - Elasticity
  - Resource sandboxing
  - Mixed OS environment
  - Resource sharing
  - Improved system utilization and reduced costs

#### **OLI Module 8 - Virtualization**

- What is Virtualization?
  - Involves the construction of an isomorphism that maps a virtual guest system to a real (or physical) host system
  - Sequence of operations *e* modify guest state
  - Mapping function V(Si)
- Virtual Machine Types
  - Process Virtual Machines
  - System Virtual Machines

# OLI Module 9 Resource Virtualization - CPU

- Steps for CPU Virtualization
  - Multiplexing a physical CPU among virtual CPUs
  - Virtualizing the ISA (Instruction Set Architecture) of a CPU
- Code Patch, Full Virtualization and Paravirtualization
- Emulation (Interpretation & Binary Translation)
- Virtual CPU

# This Week's Project

#### • P2.1: Horizontal Scaling and Autoscaling

- Horizontal scaling in / out using AWS APIs
- Load balancing, failure detection, and cost management on AWS
- Infrastructure as Code (Terraform)

#### • P2.2: Docker Containers and Kubernetes

- Building your own container-based microservices
- $\circ$  Docker containers
- Manage multiple Kubernetes Cluster
- Multi Cloud deployments

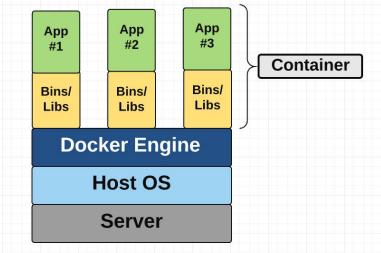

#### • P2.3: Functions as a Service

- Develop event driven cloud functions
- Deploy multiple functions to build a video processing pipeline

#### Containers

- Provides OS-level virtualization.
- Provides private namespace, network interface and IP address, etc.
- A big difference with VMs is that containers share the host system's kernel with other containers.

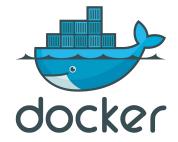

## Why Containers?

- Faster deployment
- Portable
- Modularity
- Consistent Environment

#### Build once, run anywhere

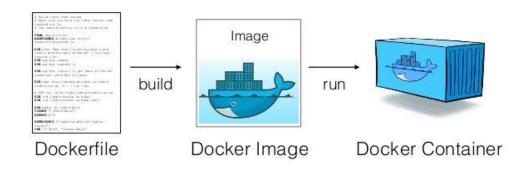

#### Docker

 Docker is an open platform for developing, shipping, and running applications.

Single Container Docker Workflow

- Dockerfile
- Docker Image
- Docker Container

#### Dockerfile

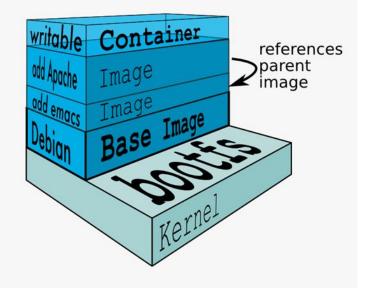

- Dockerfile tells Docker how to build an **image**:
  - Base Image
  - Commands
  - Files
  - Ports
  - Startup Command
- In short, a Dockerfile is a <u>recipe</u> for Docker images

Let's go through a sample Dockerfile!

# Debian as the base image
FROM debian:latest

# Install additional packages
RUN apk add --update emacs
RUN apk add --update apache

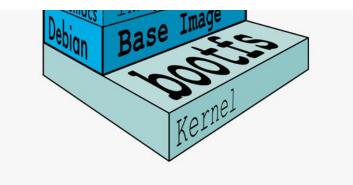

# index.html must be in the current directory
ADD index.html /home/demo/

# Define the command which runs when the container starts
CMD ["cat /home/demo/index.html"]

#### # Debian Linux as the base image FROM debian:latest

# Install additional packages
RUN apk add --update emacs
RUN apk add --update apache

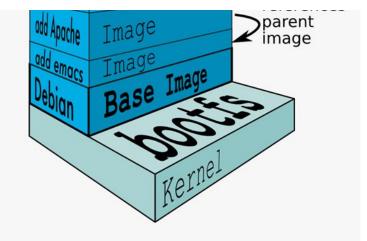

# index.html must be in the current directory
ADD index.html /home/demo/

# Define the command which runs when the container starts
CMD ["cat /home/demo/index.html"]

# Alpine Linux as the base image
FROM debian:latest

# Install additional packages
RUN apk add --update emacs
RUN apk add --update apache

# index.html must be in the current directory
ADD index.html /home/demo/

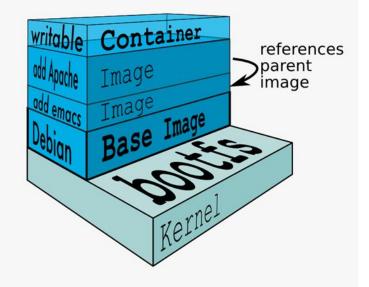

# Define the command which runs when the container starts
CMD ["cat /home/demo/index.html"]

# Alpine Linux as the base image
FROM debian:latest

# Install additional packages
RUN apk add --update emacs
RUN apk add --update apache

# index.html must be in the current directory
ADD index.html /home/demo/

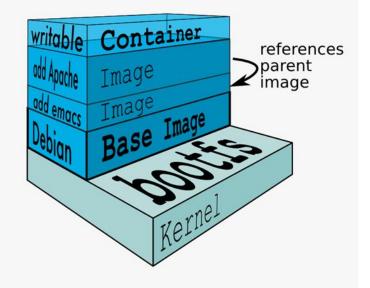

# Define the command which runs when the container starts
CMD ["cat /home/demo/index.html"]

# Alpine Linux as the base image
FROM debian:latest

# Install additional packages
RUN apk add --update emacs
RUN apk add --update apache

# index.html must be in the current directory
ADD index.html /home/demo/

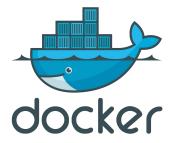

# Define the command which runs when the container starts CMD ["cat /home/demo/index.html"]

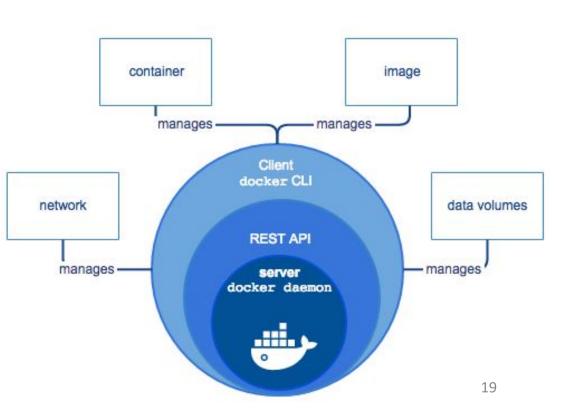

# Images & Containers

- docker build
  - Builds an image
- docker run
  - Runs a container based on an image
- Images are the blueprints (Like a Class)
  - View these with docker images
- Containers are a 'running instance of an Image' (Like an Object)
  - View these with docker ps

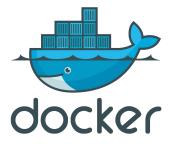

### **Docker Engine**

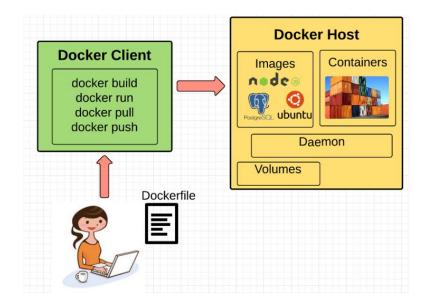

- A client-server application
  - Docker Daemon
  - Docker CLI
  - **REST API**

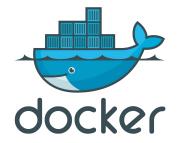

#### Docker Daemon

- Listens for Docker API requests
- Manages Docker objects
- The Daemon does not have to be on the same machine as the Client

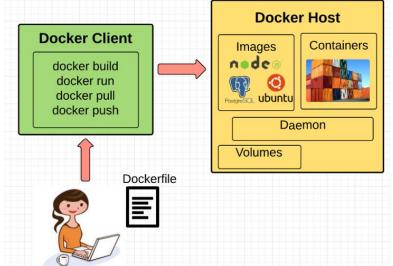

## Docker CLI

- Communicates with Daemon using an API
- When you type:

docker build nginx

You are telling the Docker client to forward the build nginx instruction to the Daemon

#### **Docker Registries**

- Store Docker images
- Examples
  - Docker Hub and Docker Cloud
  - GCP Container Registry
  - Azure Container Registry
- docker pull
- docker push

# Containers are userful, but how to manage containers?

- Containers provide many benefits
  - Fast and lightweight
  - Sandboxed and consistent
- However, using containers introduces its own complexity, e.g.,
  - Load Balancing
  - Fault Tolerance
- How should we deploy, scale and manage containers efficiently?

# Kubernetes

- <u>Kubernetes</u> is an open-source platform for automating deployment, scaling, and operations of application containers.
  - Horizontally Scalable
  - Self-Healing
  - Service Discovery
  - Automated Rollbacks
  - Utilization

#### kubernetes

# **Kubernetes** Overview

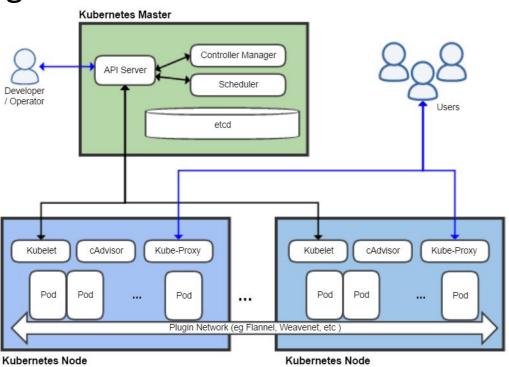

#### • API Objects

- Pods Collection of Containers
- Deployment Manages Pods
- Service Network Endpoint
- Desired State Management
  - YAML (YAML Ain't a Markdown Language)
- <u>Kubectl</u> CLI for Kubernetes
  - kubectl create config.yaml

# Kubernetes Cluster - Master

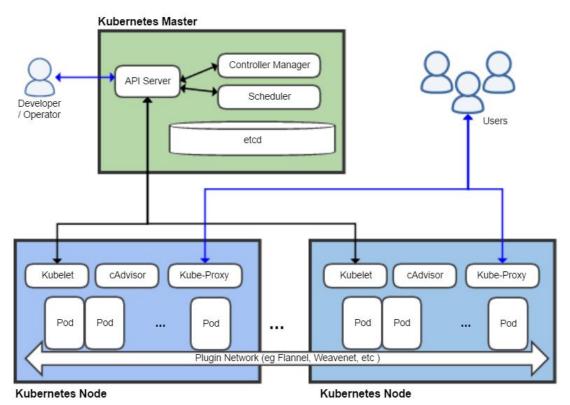

- Master Node
  - API Server
  - Controller Manager
  - Scheduler

# Kubernetes Cluster - Worker

- Worker Nodes
  - Kubelet Daemon
  - Kube-Proxy

# Sample Kubernetes Config YAML

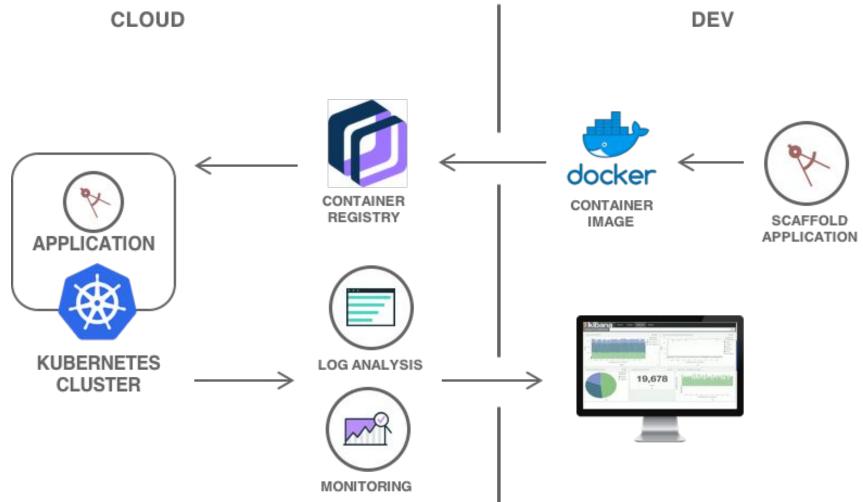

apiVersion: apps/v1beta1 kind: Pod metadata: Sample-Pod name: Sample-Pod labels: app: web front-end spec: containers: - name: front-end image: hello-app gcr.io/samples/hello-frontend:1.0 ports: - containerPort: 80 - name: hello-app image: gcr.io/samples/hello-app:1.0 ports: - containerPort: 8080

# Helm

- A tool for managing Kubernetes applications
- Helm Charts help you define, install, and upgrade complex Kubernetes application
- Chart structure:
  - Chart.yaml
    - A YAML file that contains chart information (name, version, description, etc.)
  - Values.yaml
    - The default configuration of this chart. The values listed in this file will be substituted in the files under the templates/ directory.
  - templates/
    - A directory of template files that will be combined with the values defined in Values.yaml. The files under this directory will be used to define all of the Kubernetes objects required to deploy the application.

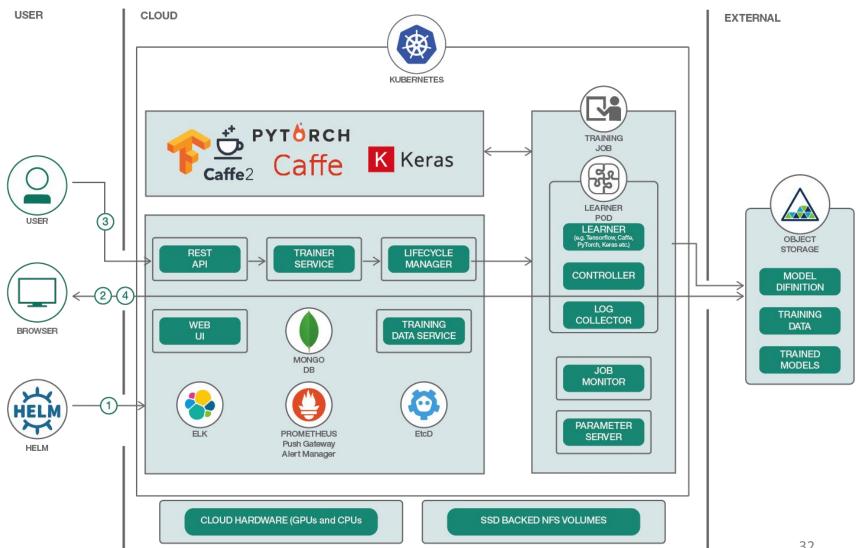

# Docker, Kubernetes Workflow

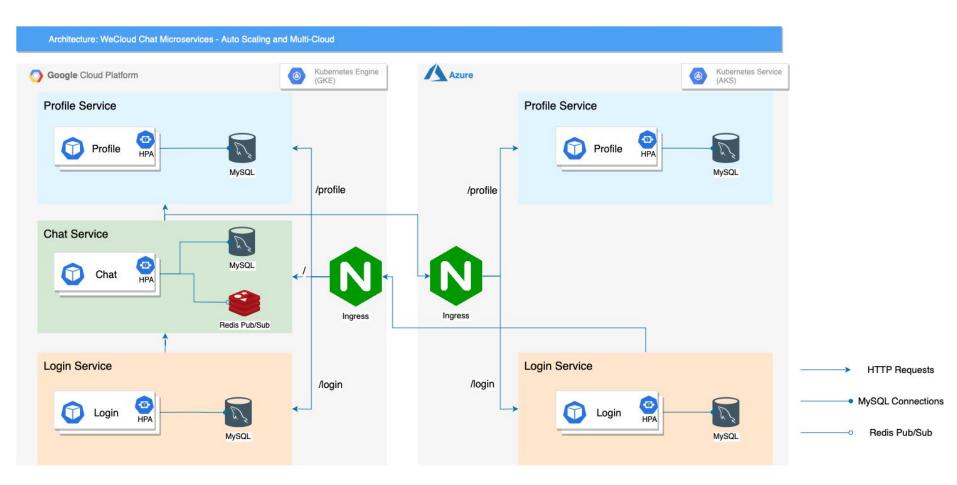

## Microservice Architecture

- Loosely coupled applications, that generally communicate over a network and exist independently of each other.
- Why Microservice
  - Application Size
  - Scalability
  - Modifiability
  - Fault-tolerance

## An Industrial Example

#### Project 2.2 - Containers & Kubernetes

## Project 2.2 - Containers & Kubernetes

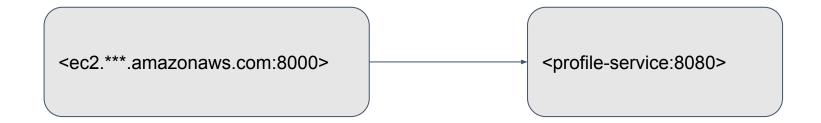

- Build a chat room application using the microservice pattern
- Project overview:
  - <u>Task 1</u>: Containerize the profile service and run it locally
  - <u>Task 2</u>: Deploy the profile service to GKE
  - <u>Task 3</u>: Migrate the profile service's database from H2 to MySQL. Use Helm to manage the Kubernetes application.
  - <u>Task 4</u>: Install the chat service and login service using Helm charts. Connect the microservices to build an application.
  - <u>Task 5</u>: Replicate the profile and login services to AKS.
     Implement autoscaling rules to horizontally scale pods.
  - <u>Task 6</u>: DNS using Azure front door service

# Task 1 - Containerize Profile Service

- Introduction to Dockerfiles
- Become familiar with the Docker CLI
  - docker build
  - o docker images
  - o docker run
  - o docker ps
- Containerizing Java applications (a REST service)
- Consider the interactions between the host machine and the container
  - See the next slide

# Task 1 - Containerize Profile Service

- Run a Docker container to host the profile service
  - $\circ$   $\,$  The Profile service exposes port 8080 on the container  $\,$
  - Port 8000 of VM is mapped to the container port
- How do we achieve this port mapping?

# Task 2 - Using GCR and GKE to Deploy the Profile Service

- Push your image to a private registry
  - Push the profile service Docker image to Google
     Container Registry (GCR)
- Define a Kubernetes YAML configuration to
  - Create a deployment based on the image pushed to GCR
  - Expose the profile service via a (GCP) load balancer

# Task 2 - Using GCR and GKE to Deploy the Profile Service

- Profile service architecture
- The backend application accepts
   GET requests at /profile
- The load balancer will map port 80 to port 8080

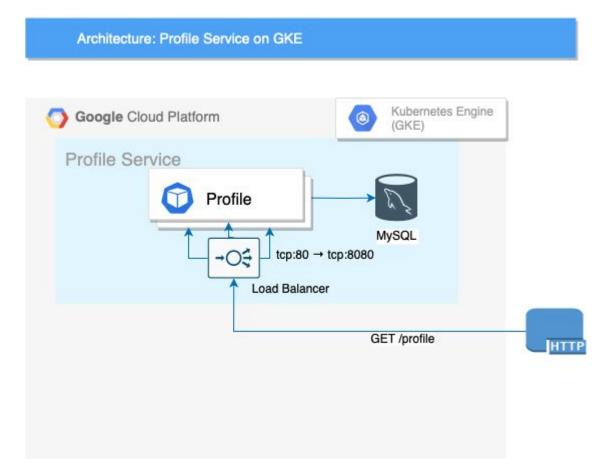

Google Cloud Platform	۲	Kubernetes Engine (GKE)	
Profile Service	0		
Profile	H2 DB		
	tcp:80 → tcp:8080		
	ad Balancer		
	GE	T /profile	-
			_

#### Task 3 - Introduction to Helm Charts

- Deploy a MySQL database using Helm
  - Update the profile service to use MySQL instead of the embedded H2 database
  - Remember to push your updated image to GCR!
- Develop a Helm chart for the profile service
   Release the profile service via helm

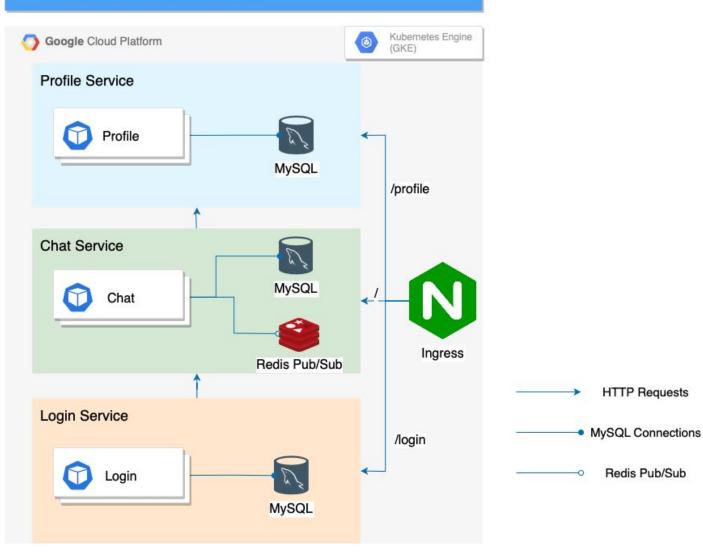

# Task 3 - Use Helm Charts and Migrating to MySQL

- Profile service architecture (MySQL)
- The backend application accepts GET requests at /profile
- The load balancer should map 80 to 8080

- Builds on Task 3
  - Additional login and group chat services
- Login service
  - Requires a separate MySQL database to store user login information
- Group chat service
  - Redis Pub/Sub messaging channel for scalability and real time communication
  - A **separate** MySQL database to persist messages

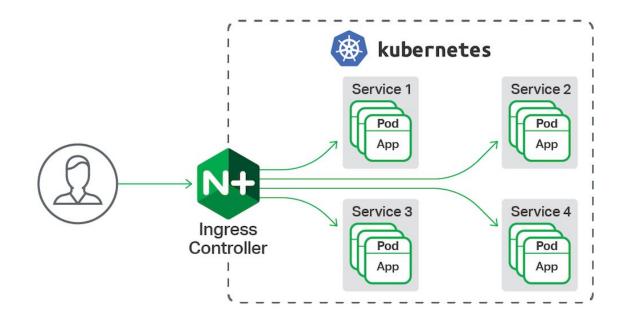

Architecture: WeCloud Chat Microservices

- Ingress: An API object that manages external access to the services in a cluster, typically HTTP.
- Ingress exposes HTTP and HTTPS routes from outside the cluster to services within the cluster. Traffic routing is controlled by rules defined on the Ingress resource.
- In our case for Task 4, we have the following port mapping:

path	serviceName	servicePort
/	spring-redis-websocket-service	80
/login	spring-login-service	80
/profile	spring-profile-service	80

 You must have an <u>ingress controller</u> to satisfy an Ingress. Only creating an Ingress resource has no effect. An <u>Ingress</u> <u>controller</u> is responsible for fulfilling the Ingress, usually with a load balancer. You may need to deploy an Ingress controller such as <u>ingress-nginx</u>.

# Task 5 - Autoscaling, Multiple Cloud Deployment and Fault Tolerance

- Builds upon Task 4
  - Consider how to handle downstream service failures
- Achieving high availability
  - Multi cloud deployments!
  - Autoscaling Kubernetes deployments to accommodated increased traffic
  - Use the HorizontalPodAutoscaler Kubernetes
     object to scale the pods

# Task 5 - Auto-scaling, Multiple Cloud Deployment and Fault-tolerance

# Task 6 - Domain Name and Azure Front Door Service

- In this task, you will use Azure Front Door Service to achieve a path-based routing to the web application deployed on Azure and GCP.

 We will define Domain Name System (DNS) to map two IP address from previous tasks, to a single domain name.

# Tips, Trips, and Tricks

- Debug, debug, debug
  - This project has many moving pieces!
  - Where is the issue occurring?
  - What is the expected behavior of the system?
- Pods and Logs
  - Did my pod start?
    - (kubectl get pods , kubectl describe pods)
  - Is my pod generating any logs?
    - (kubectl logs ...)

#### Project 2.2 Penalties

#### **Project Grading Penalties**

The following table outlines the violations of the project rules and their corresponding grade penalties for this project.

Note that a penalty is the absolute value as per the table, not calculated by a percentage of your total score.

Violation	Penalty of the project grade
Incomplete submission of required files	-10%
Submitting your credentials, other secrets, or Andrew Id in your code for grading	-100%
Submitting only executables (.jar, .pyc, etc.) without human-readable code (.py, .java, .sh, etc.)	-100%
Attempting to hack/tamper the grader	-100%
Cheating, plagiarism or unauthorized assistance (please refer to the university policy on academic integrity and our syllabus)	-200% or R in the course

# **Upcoming Deadlines**

- Code Review Project 1.2
  - Due on <u>Wednesday</u>, Sept 30th, 2020, 11:59PM ET
- Online Programming Exercises
  - You will be notified of your schedule by email
  - Attend your scheduled session!
- Quiz 4 (OLI Modules 7, 8 & 9)
  - Due on Friday, Oct 2nd, 2020, 11:59PM ET
- Project 2.2
  - Due on Sunday, Oct 4th, 2020, 11:59PM ET

#### Questions?
