Lecture 23:

Social Choice II

Teachers:

Zico Kolter

Ariel Procaccia (this time)

### REMINDER: VOTING

- Set of voters  $N = \{1, ..., n\}$
- Set of alternatives A, |A| = m
- Each voter has a ranking over the alternatives
- $x >_i y$  means that voter i prefers x to y
- Preference profile  $\Rightarrow$  = collection of all voters' rankings
- Voting rule f = function from preference profiles to alternatives
- Important: so far voters were honest!

### MANIPULATION

- Using Borda count
- Top profile: b wins
- Bottom profile: a wins
- By changing his vote, voter 3 achieves a better outcome!

1	2	3
b	b	а
а	а	b
С	С	С
d	d	d

1	2	3
b	b	а
а	а	С
С	С	d
d	d	b

### BORDA RESPONDS TO CRITICS

My scheme is intended only for honest men!

Random 18<sup>th</sup>
Century
French Dude

### STRATEGYPROOFNESS

• A voting rule is strategyproof (SP) if a voter can never benefit from lying about his preferences:

$$\forall \vec{\prec}, \forall i \in N, \forall \prec'_i, f(\vec{\prec}) \geqslant_i f(\prec'_i, \vec{\prec}_{-i})$$

- Poll 1: Maximum value of m for which plurality is SP?
  - <u>1.</u> 2
  - *2.* 3
  - *3.* 4
  - 4. 00

### STRATEGYPROOFNESS

- A voting rule is dictatorial if there is a voter who always gets his most preferred alternative
- A voting rule is constant if the same alternative is always chosen
- Constant functions and dictatorships are SP

Dictatorship

Constant function

# GIBBARD-SATTERTHWAITE

- A voting rule is **onto** if any alternative can win
- Theorem (Gibbard-Satterthwaite): If  $m \geq 3$  then any voting rule that is SP and onto is dictatorial
- In other words, any voting rule that is onto and nondictatorial is manipulable

Gibbard

Satterthwaite

# CIRCUMVENTING G-S

- Restricted preferences (this lecture)
- Money ⇒ mechanism design (not covered)
- Computational complexity (this lecture)

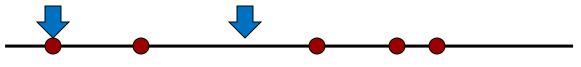

#### SINGLE PEAKED PREFERENCES

- We want to choose a location for a public good (e.g., library) on a street
- Alternatives = possible locations
- Each voter has an ideal location (peak)
- The closer the library is to a voter's peak, the happier he is

#### SINGLE PEAKED PREFERENCES

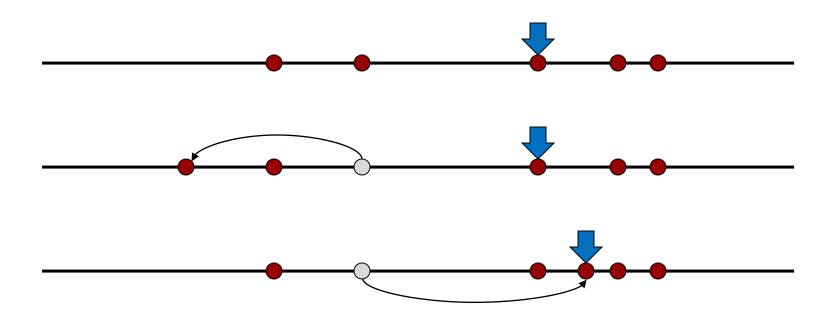

- Leftmost point mechanism: return the leftmost point
- Midpoint mechanism: return the average of leftmost and rightmost points
- Poll 2: Which mechanism is SP?
  - Only leftmost point
  - Only midpoint
  - Both 3.
  - Neither

#### THE MEDIAN

- Select the median peak
- The median is a Condorcet winner!
- The median is onto
- The median is nondictatorial

# THE MEDIAN IS SP

#### COMPLEXITY OF MANIPULATION

- Manipulation is always possible in theory
- But can we design voting rules where it is difficult in practice?
- Are there "reasonable" voting rules where manipulation is a hard computational problem? [Bartholdi et al. 1989]

#### THE COMPUTATIONAL PROBLEM

- f-Manipulation problem:
  - Given votes of nonmanipulators and a preferred alternative p
  - Can manipulator cast vote that makes puniquely win under f?
- Example: Borda, p = a

1	2	3
b	b	
а	а	
С	С	
d	d	

1	2	3
b	b	а
а	а	С
С	С	d
d	d	b

### A GREEDY ALGORITHM

- Rank p in first place
- While there are unranked alternatives:
  - o If there is an alternative that can be placed in next spot without preventing p from winning, place this alternative
  - Otherwise return false

### EXAMPLE: BORDA

1	2	3	1	2	3	1	2	3
b	b	а	b	b	а	b	b	а
a	а		а	а	b	a	а	С

е	2	3	3	2	-

Preference profile

### WHEN DOES THE ALG WORK?

- Theorem [Bartholdi et al., SCW 89]: Fix  $i \in \mathbb{N}$  and the votes of other voters. Let f be a rule s.t.  $\exists$ function  $s(\prec_i, x)$  such that:
  - 1. For every  $\prec_i$ , f chooses a alternative that uniquely maximizes  $s(\prec_i, x)$
  - 2.  $\{y: y \prec_i x\} \subseteq \{y: y \prec_i' x\} \Rightarrow s(\prec_i, x) \leq s(\prec_i', x)$

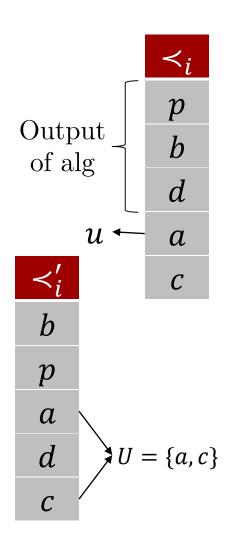

Then the algorithm always decides f-Manipulation correctly

Does Borda count have such a score function?

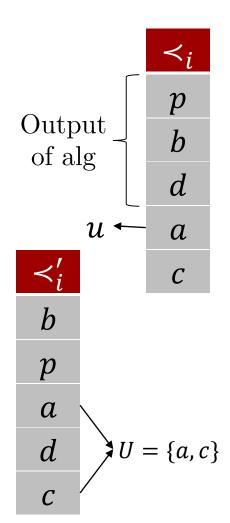

### PROOF OF THEOREM

- Suppose the algorithm failed, producing a partial ranking  $\prec_i$
- Assume for contradiction  $\prec_i'$  makes p win
- $U \leftarrow$  alternatives not ranked in  $\prec_i$
- $u \leftarrow \text{highest ranked alternative in } U$  according to  $\prec_i'$
- Complete  $\prec_i$  by adding u first, then others arbitrarily

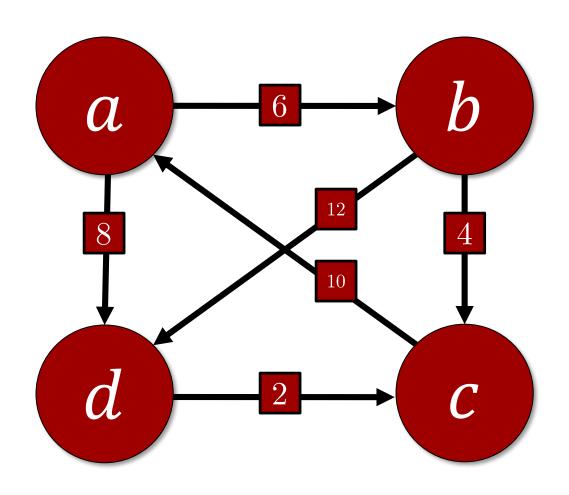

#### PROOF OF THEOREM

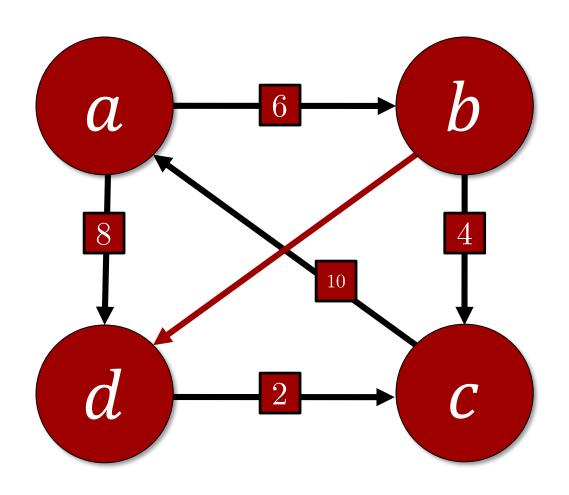

- Property  $2 \Rightarrow s(\prec_i, p) \ge s(\prec_i', p)$
- Property 1 and  $\prec'$  makes p the winner  $\Rightarrow s(\prec'_i, p) > s(\prec'_i, u)$
- Property  $2 \Rightarrow s(\prec_i', u) \ge s(\prec_i, u)$
- Conclusion:  $s(\prec_i, p) > s(\prec_i, u)$ , so the alg could have inserted u next  $\blacksquare$

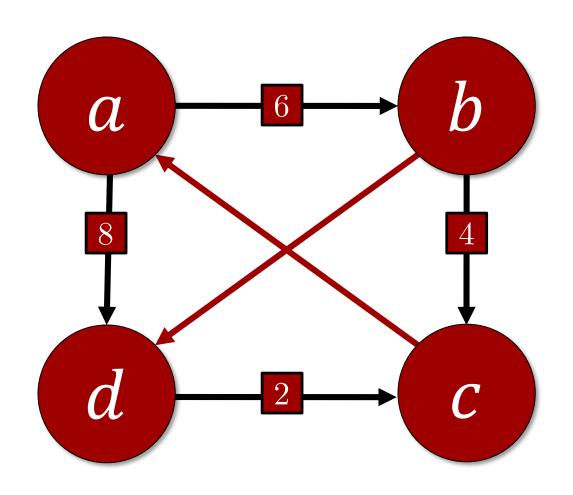

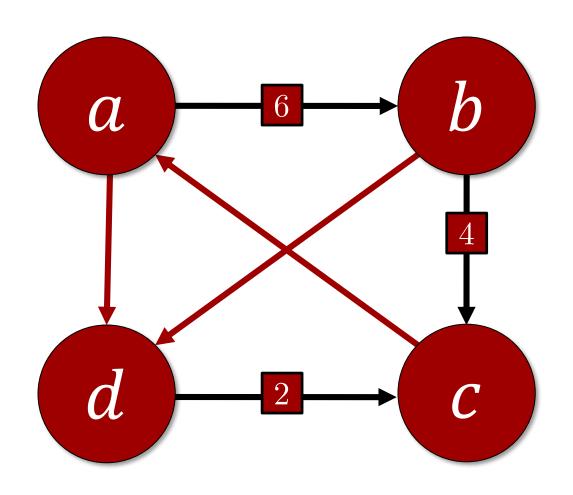

#### HARD-TO-MANIPULATE RULES

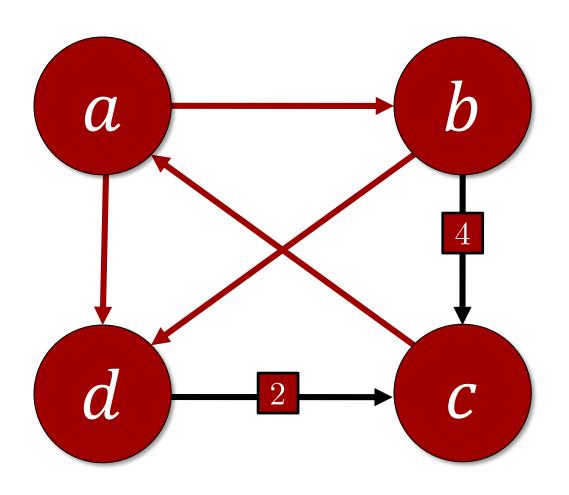

- Copeland with second order tie breaking [Bartholdi et al. 1989]
- STV [Bartholdi and Orlin 1991]
- Ranked Pairs [Xia et al. 2009]
  - Sort pairwise comparisons by strength
  - Lock in pairwise comparisons in that order, unless a cycle is created, in which case the opposite edge is locked in
  - Return the alternative at the top of the induced order

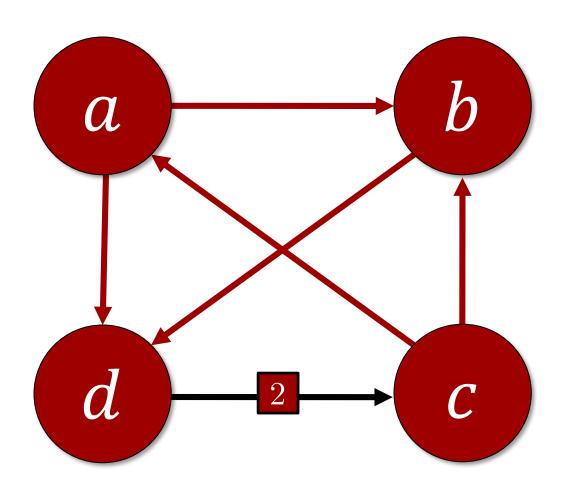

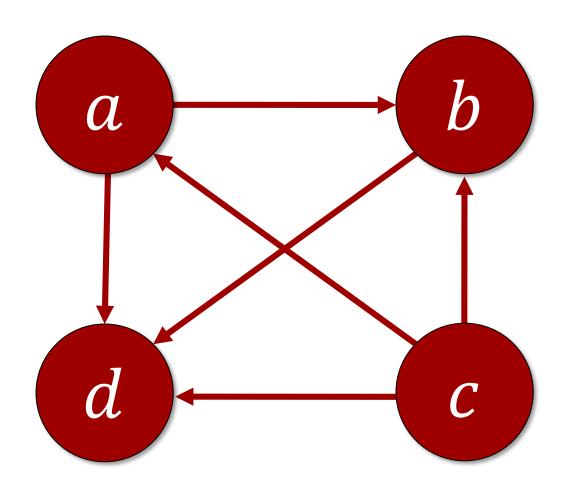

### SUMMARY

- Definitions, theorems, algorithms:
  - Strategyproof voting rules
  - The Gibbard-Satterthwaite Theorem
  - Greedy manipulation algorithm
- Big ideas:
  - Voting rules are provably manipulable
  - Circumvent via restricted preferences
  - Circumvent via computational complexity
