

Machine-Level Programming III: Procedures

15-213/18-213: Introduction to Computer Systems

7th Lecture, June 5, 2018

Instructor:

Brian Railing

Reminder: Condition Codes

■ Single bit registers

- **CF** Carry Flag (for unsigned) **SF** Sign Flag (for signed)
- **ZF** Zero Flag **OF** Overflow Flag (for signed)

■ jX and SetX instructions

jX	Condition	Description
jmp	1	Unconditional
je	ZF	Equal / Zero
jne	~ZF	Not Equal / Not Zero
js	SF	Negative
jns	~SF	Nonnegative
jg	~(SF^OF) & ~ZF	Greater (Signed)
jge	~(SF^OF)	Greater or Equal (Signed)
jl	(SF^OF)	Less (Signed)
jle	(SF^OF) ZF	Less or Equal (Signed)
ja	~CF & ~ZF	Above (unsigned)
jb	CF	Below (unsigned)

SetX	Condition	Description
sete	ZF	Equal / Zero
setne	~ZF	Not Equal / Not Zero
sets	SF	Negative
setns	~SF	Nonnegative
setg	~(SF^OF) & ~ZF	Greater (Signed)
setge	~(SF^OF)	Greater or Equal (Signed)
setl	(SF^OF)	Less (Signed)
setle	(SF^OF) ZF	Less or Equal (Signed)
seta	~CF & ~ZF	Above (unsigned)
setb	CF	Below (unsigned)

Machine Level Programming – Control

■ C Control

- if-then-else
- do-while
- while, for
- switch

■ Assembler Control

- Conditional jump
- Conditional move
- Indirect jump (via jump tables)
- Compiler generates code sequence to implement more complex control

■ Standard Techniques

- Loops converted to do-while or jump-to-middle form
- Large switch statements use jump tables

Mechanisms in Procedures

■ Passing control

- To beginning of procedure code
- Back to return point

■ Passing data

- Procedure arguments
- Return value

■ Memory management

- Allocate during procedure execution
- Deallocate upon return

■ Mechanisms all implemented with machine instructions

■ x86-64 implementation of a procedure uses only those mechanisms required

```
P (...) {  
    •  
    •  
    y = Q(x);  
    print(y)  
    •  
}
```

```
int Q(int i)  
{  
    int t = 3*i;  
    int v[10];  
    •  
    •  
    return v[t];  
}
```

Mechanisms in Procedures

■ Passing control

- To beginning of procedure code
- Back to return point

■ Passing data

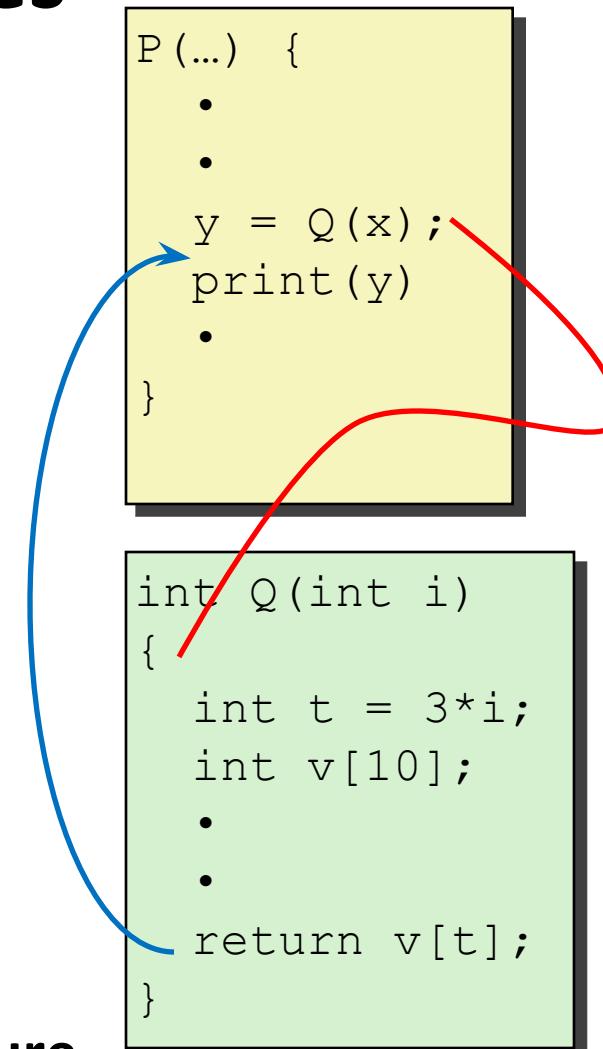

- Procedure arguments
- Return value

■ Memory management

- Allocate during procedure execution
- Deallocate upon return

■ Mechanisms all implemented with machine instructions

■ x86-64 implementation of a procedure uses only those mechanisms required

Mechanisms in Procedures

■ Passing control

- To beginning of procedure code
- Back to return point

■ Passing data

- Procedure arguments
- Return value

■ Memory management

- Allocate during procedure execution
- Deallocate upon return

■ Mechanisms all implemented with machine instructions

■ x86-64 implementation of a procedure uses only those mechanisms required

```
P (...) {  
    •  
    •  
    y = Q(x);  
    print(y)  
    •  
}
```

```
int Q(int i)  
{  
    int t = 3*i;  
    int v[10];  
    •  
    •  
    return v[t];  
}
```

Mechanisms in Procedures

■ Passing control

- To beginning of procedure code
- Back to return point

■ Passing data

- Procedure arguments
- Return value

■ Memory management

- Allocate during procedure execution
- Deallocate upon return

■ Mechanisms all implemented with machine instructions

■ x86-64 implementation of a procedure uses only those mechanisms required

```
P (...) {  
    •  
    •  
    y = Q(x);  
    print(y)  
    •  
}
```

```
int Q(int i)  
{  
    int t = 3*i;  
    int v[10];  
    •  
    •  
    return v[t];  
}
```

Mechanisms in Procedures

```
P( ) {
```

Machine instructions implement the mechanisms, but the choices are determined by designers. These choices make up the **Application Binary Interface (ABI)**.

- Allocate during procedure execution
 - Deallocate upon return
- **Mechanisms all implemented with machine instructions**
- **x86-64 implementation of a procedure uses only those mechanisms required**

```
int v[10],  
    int v[10];  
•  
•  
return v[t];  
}
```

Today

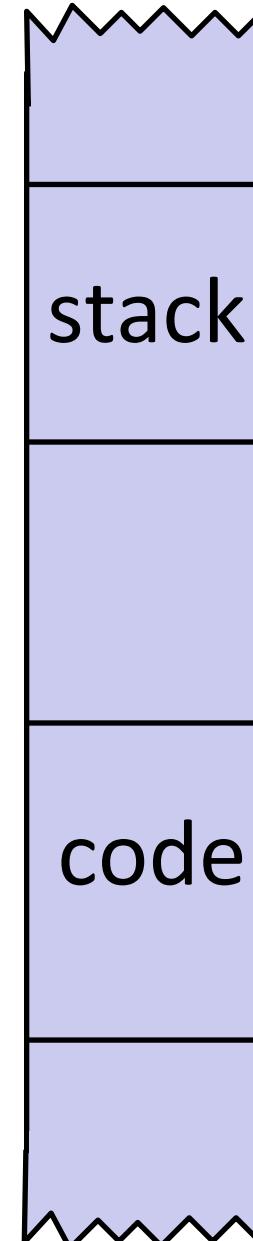

■ Procedures

- Stack Structure
- Calling Conventions
 - Passing control
 - Passing data
 - Managing local data
- Illustration of Recursion

x86-64 Stack

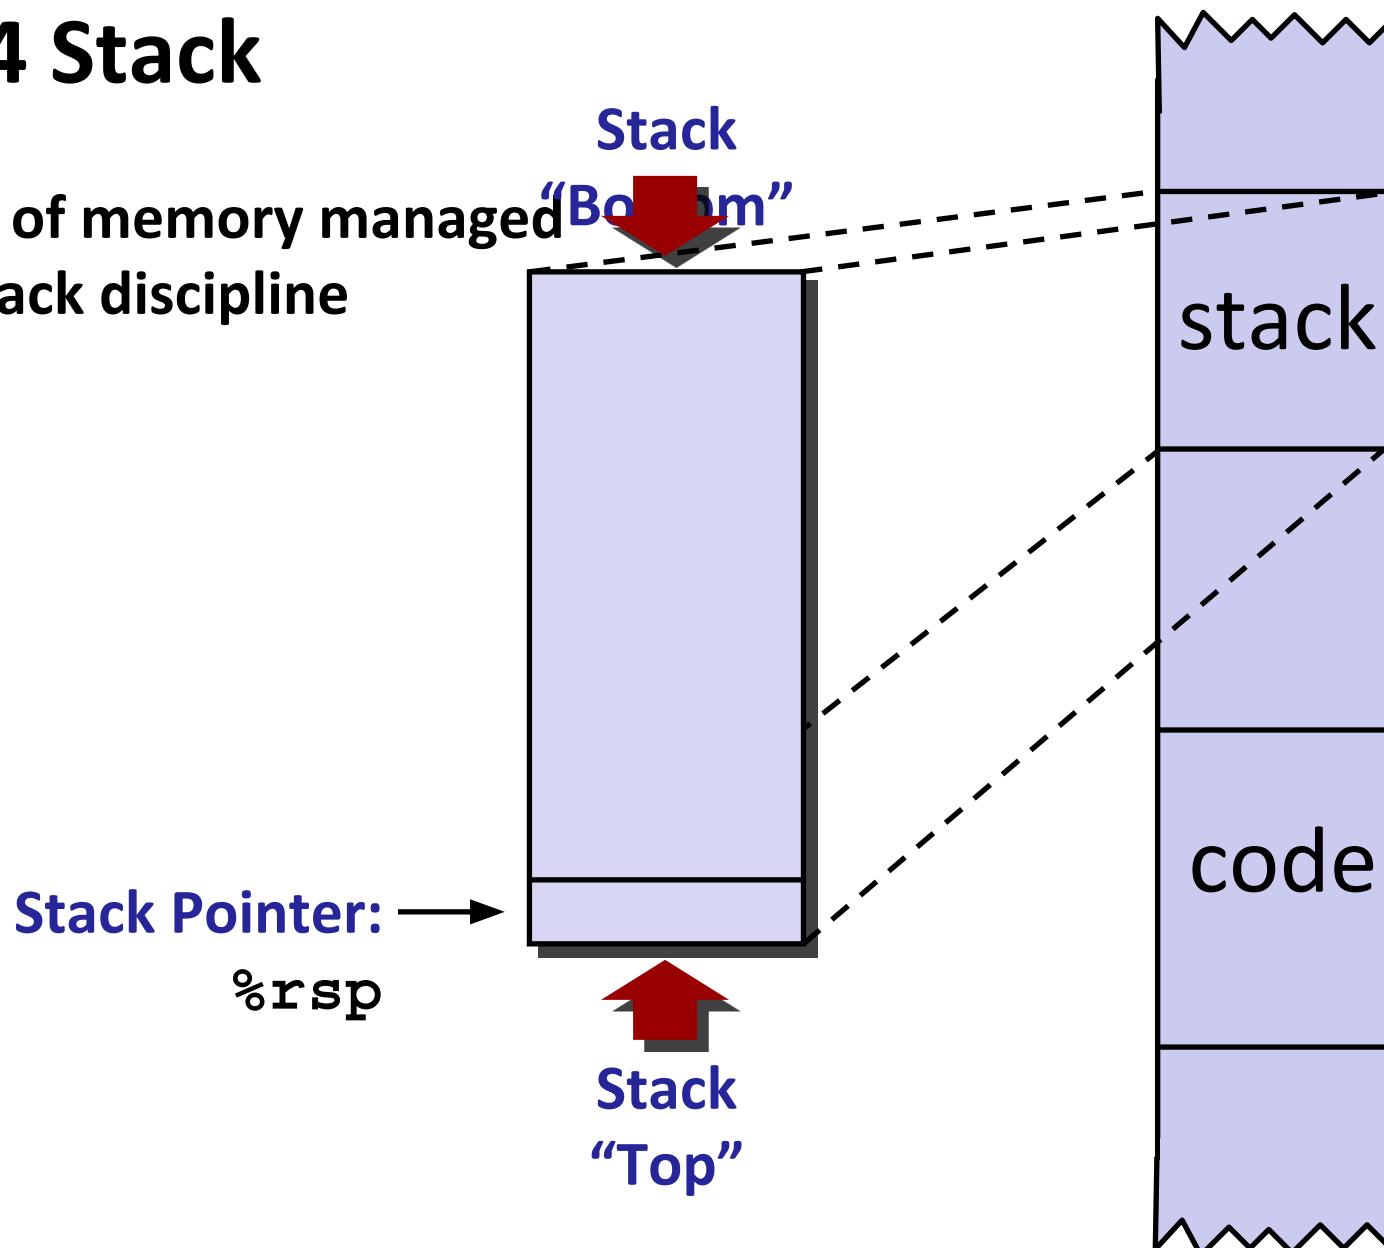

■ Region of memory managed with stack discipline

- Memory viewed as array of bytes.
- Different regions have different purposes.
- (Like ABI, a policy decision)

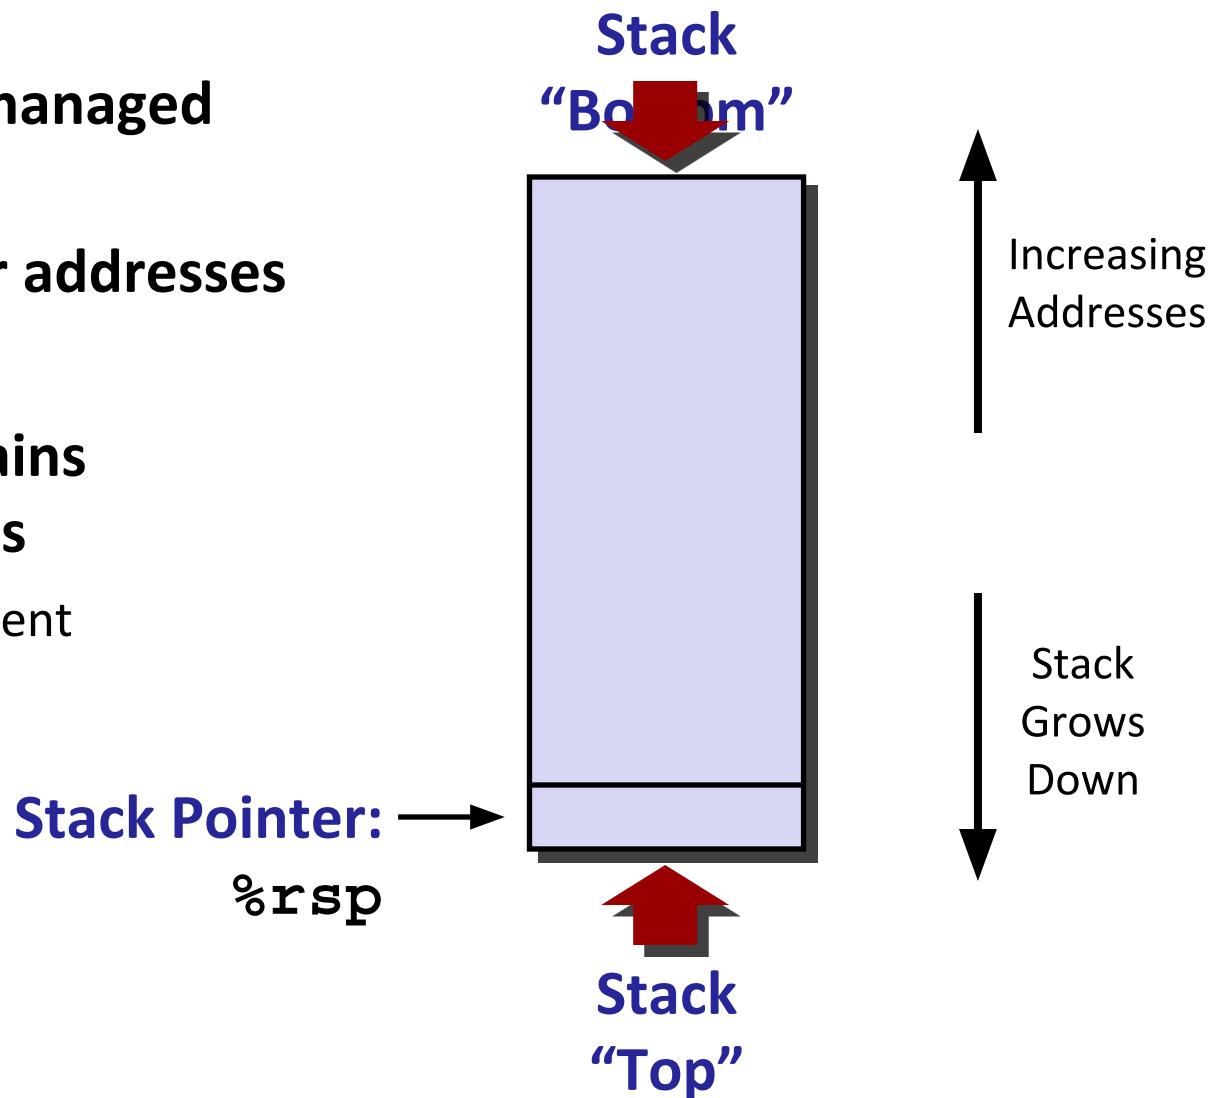

x86-64 Stack

- Region of memory managed with stack discipline

x86-64 Stack

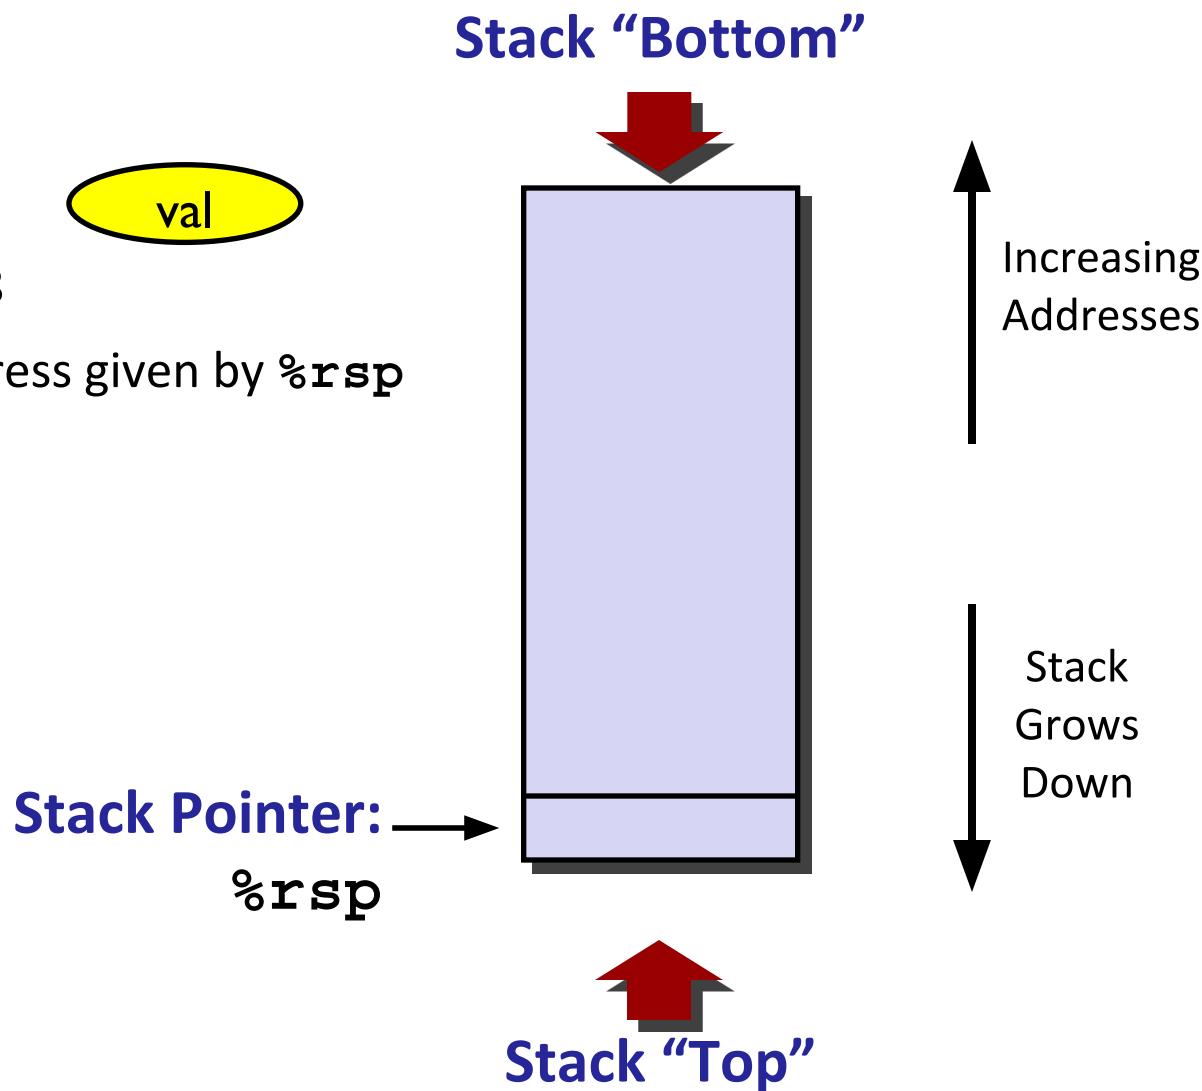

- Region of memory managed with stack discipline
- Grows toward lower addresses
- Register `%rsp` contains lowest stack address
 - address of “top” element

x86-64 Stack: Push

■ **pushq Src**

- Fetch operand at *Src*
- Decrement `%rsp` by 8
- Write operand at address given by `%rsp`

x86-64 Stack: Push

■ **pushq Src**

- Fetch operand at *Src*
- Decrement `%rsp` by 8
- Write operand at address given by `%rsp`

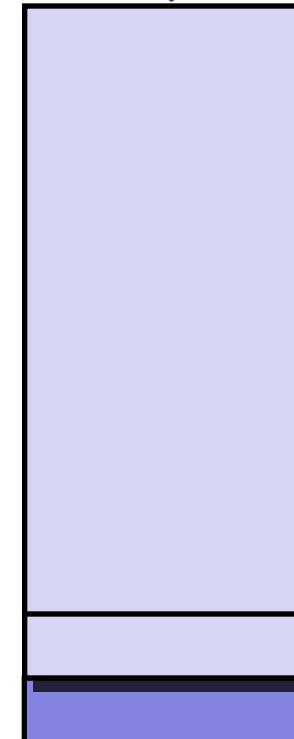

val

Stack Pointer:

`%rsp`

-8

Stack “Bottom”

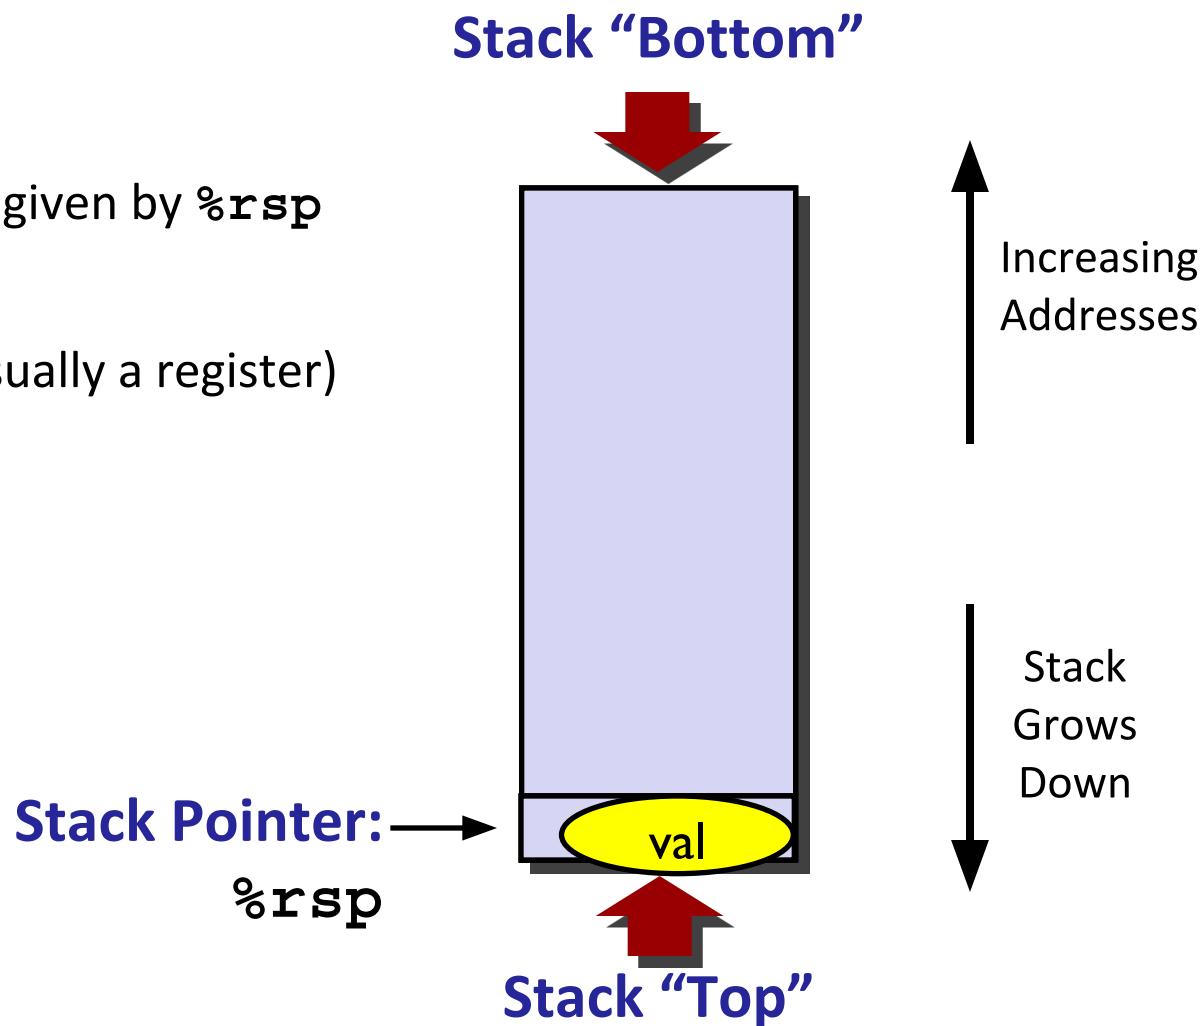

Stack
Grows
Down

Stack “Top”

x86-64 Stack: Pop

■ **popq Dest**

- Read value at address given by `%rsp`
- Increment `%rsp` by 8
- Store value at Dest (usually a register)

x86-64 Stack: Pop

■ **popq Dest**

- Read value at address given by `%rsp`
- Increment `%rsp` by 8
- Store value at Dest (usually a register)

val

Stack Pointer:

`%rsp`

Stack “Bottom”

Stack “Top”

x86-64 Stack: Pop

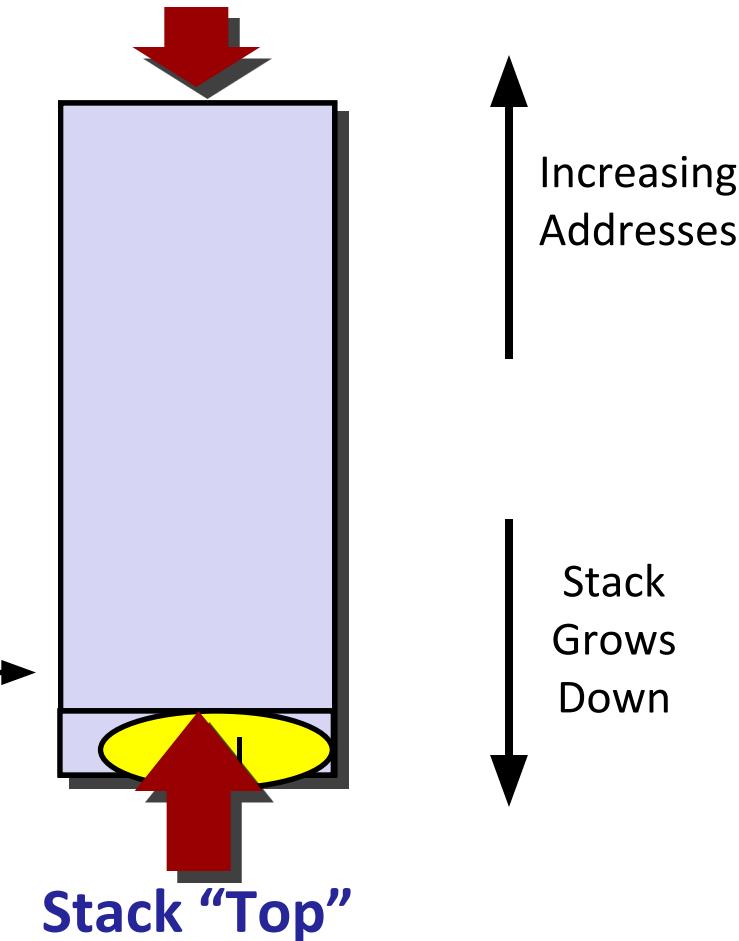

■ **popq Dest**

- Read value at address given by `%rsp`
- Increment `%rsp` by 8
- Store value at Dest (usually a register)

Stack Pointer: →
`%rsp`

(The memory doesn't change,
only the value of `%rsp`)

Stack “Bottom”

Today

■ Procedures

- Stack Structure
- Calling Conventions
 - Passing control
 - Passing data
 - Managing local data
- Illustration of Recursion

Code Examples

```
void multstore(long x, long y, long  
*dest)  
{  
    long t = mult2(x, y);  
    *dest = t;  
}
```

```
000000000400540 <multstore>:  
400540: push    %rbx      # Save %rbx  
400541: mov     %rdx,%rbx   # Save dest  
400544: callq   400550 <mult2>  # mult2(x,y)  
400549: mov     %rax,(%rbx)  # Save at dest  
40054c: pop     %rbx      # Restore %rbx  
40054d: retq          # Return
```

```
long mult2(long a, long b)  
{  
    long s = a * b;  
    return s;  
}
```

```
000000000400550 <mult2>:  
400550: mov     %rdi,%rax   # a  
400553: imul   %rsi,%rax   # a * b  
400557: retq          # Return
```

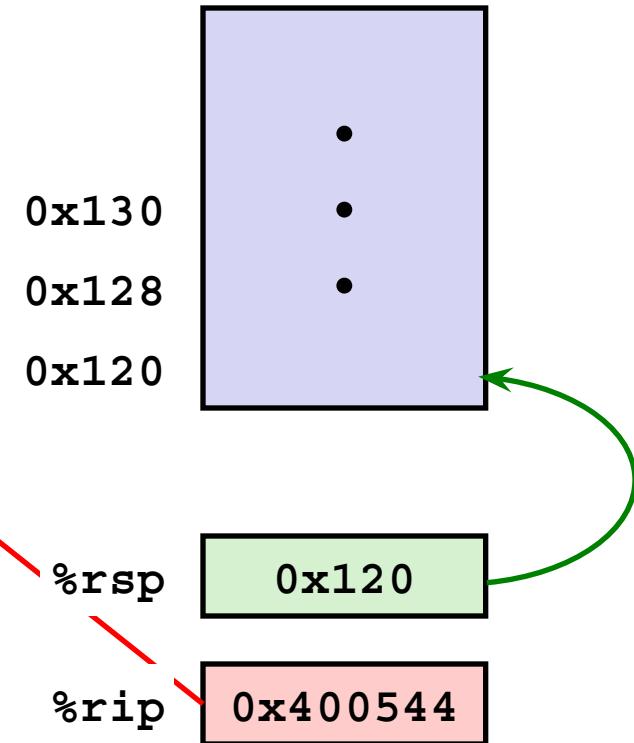

Procedure Control Flow

- Use stack to support procedure call and return
- **Procedure call: `call label`**
 - Push return address on stack
 - Jump to *label*
- **Return address:**
 - Address of the next instruction right after call
 - Example from disassembly
- **Procedure return: `ret`**
 - Pop address from stack
 - Jump to address

Control Flow Example #1

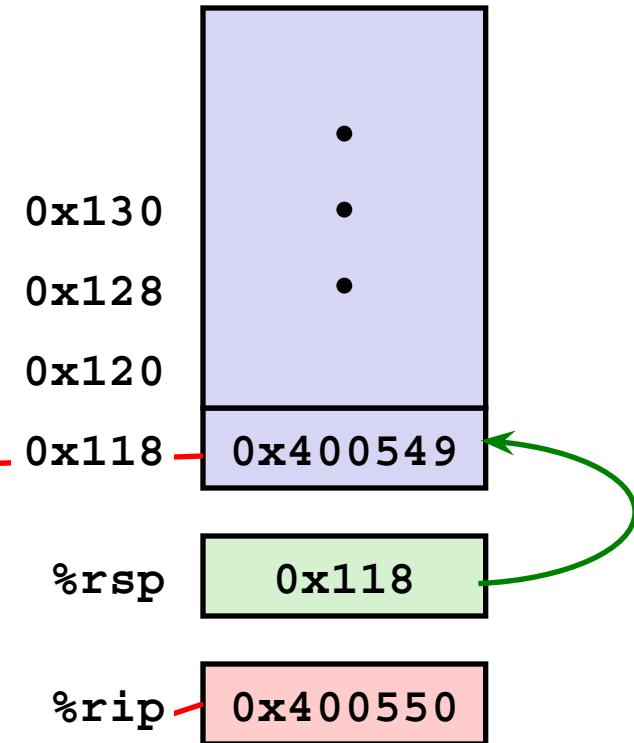

```
0000000000400540 <multstore>:  
.  
.  
400544: callq 400550 <mult2>  
400549: mov    %rax, (%rbx)  
.  
.
```

```
0000000000400550 <mult2>:  
400550: mov    %rdi,%rax  
.  
.  
400557: retq
```

Control Flow Example #2

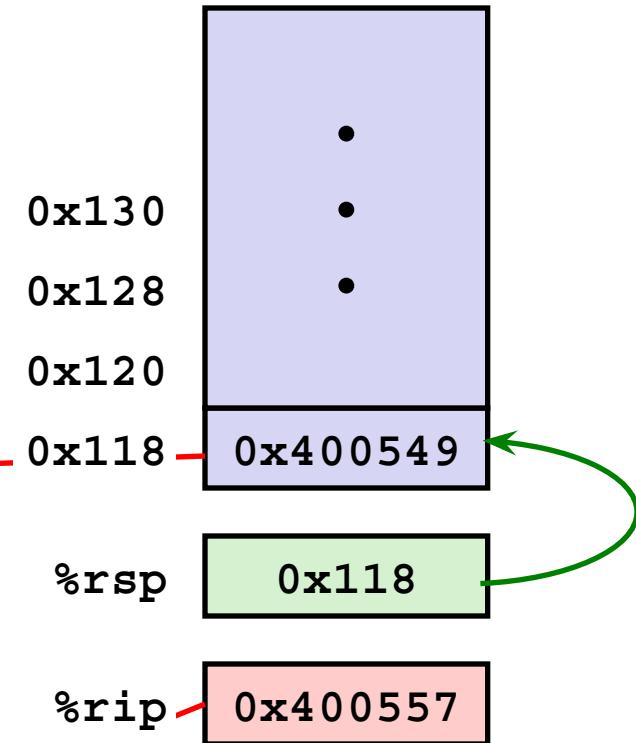

```
0000000000400540 <multstore>:  
.  
.  
400544: callq 400550 <mult2>  
400549: mov    %rax, (%rbx) ←
```

```
0000000000400550 <mult2>:  
400550: mov    %rdi,%rax ←  
. .  
400557: retq
```

Control Flow Example #3

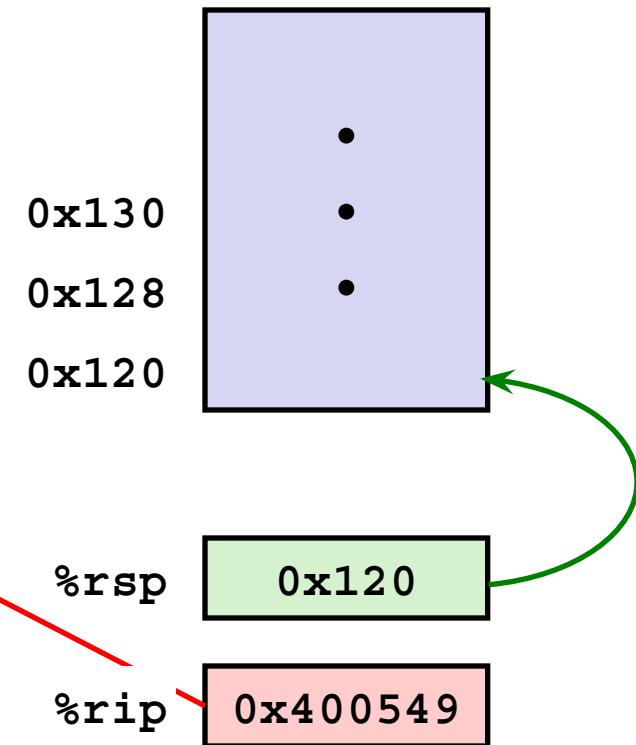

```
0000000000400540 <multstore>:  
.  
.  
400544: callq 400550 <mult2>  
400549: mov    %rax, (%rbx) ←
```

```
0000000000400550 <mult2>:  
400550: mov    %rdi,%rax  
. .  
400557: retq ←
```

Control Flow Example #4

```
0000000000400540 <multstore>:  
.  
.  
400544: callq  400550 <mult2>  
400549: mov     %rax, (%rbx) →  
.  
.
```

```
0000000000400550 <mult2>:  
400550: mov     %rdi,%rax  
.  
.  
400557: retq
```

Today

■ Procedures

- Stack Structure
- Calling Conventions
 - Passing control
 - Passing data
 - Managing local data
- Illustrations of Recursion & Pointers

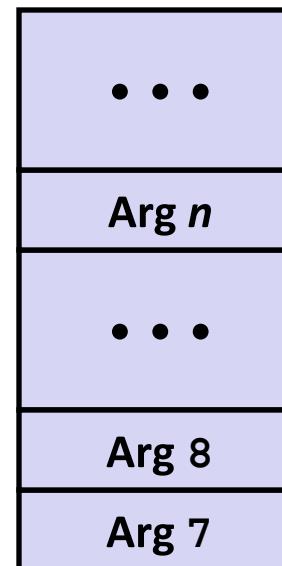

Procedure Data Flow

Registers

- First 6 arguments

Stack

- Return value

- Only allocate stack space when needed

Data Flow Examples

```
void multstore
    (long x, long y, long *dest)
{
    long t = mult2(x, y);
    *dest = t;
}
```

```
000000000400540 <multstore>:
# x in %rdi, y in %rsi, dest in %rdx
...
400541: mov    %rdx,%rbx    # Save dest
400544: callq   400550 <mult2>    # mult2(x,y)
# t in %rax
400549: mov    %rax,(%rbx)    # Save at dest
...
```

```
long mult2
(long a, long b)
{
    long s = a * b;
    return s;
}
```

```
000000000400550 <mult2>:
# a in %rdi, b in %rsi
400550: mov    %rdi,%rax    # a
400553: imul   %rsi,%rax    # a * b
# s in %rax
400557: retq   # Return
```

Today

■ Procedures

- Stack Structure
- Calling Conventions
 - Passing control
 - Passing data
 - Managing local data
- Illustration of Recursion

Stack-Based Languages

■ Languages that support recursion

- e.g., C, Pascal, Java
- Code must be “*Reentrant*”
 - Multiple simultaneous instantiations of single procedure
- Need some place to store state of each instantiation
 - Arguments
 - Local variables
 - Return pointer

■ Stack discipline

- State for given procedure needed for limited time
 - From when called to when return
- Callee returns before caller does

■ Stack allocated in *Frames*

- state for single procedure instantiation

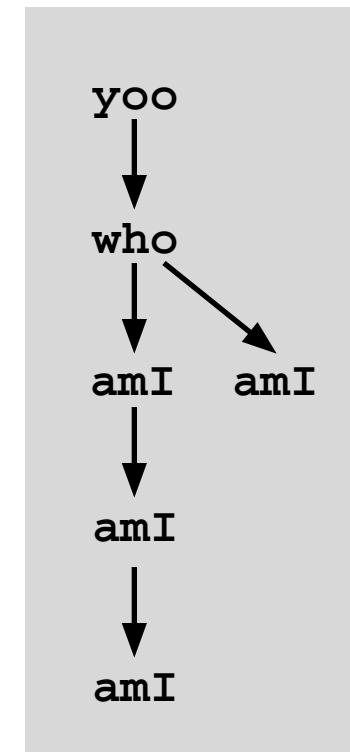

Call Chain Example

```
yoo (...)  
{  
    •  
    •  
    who () ;  
    •  
    •  
}
```

```
who (...)  
{  
    • • •  
    amI () ;  
    • • •  
    amI () ;  
    • • •  
}
```

```
amI (...)  
{  
    •  
    •  
    amI () ;  
    •  
    •  
}
```

Example Call Chain

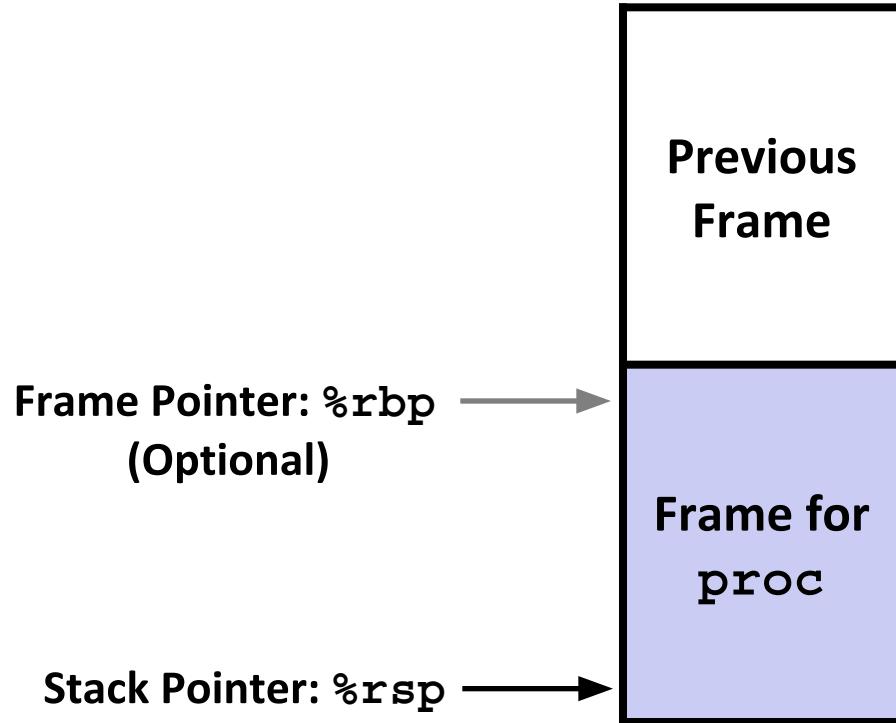

Procedure amI () is recursive

Stack Frames

■ Contents

- Return information
- Local storage (if needed)
- Temporary space (if needed)

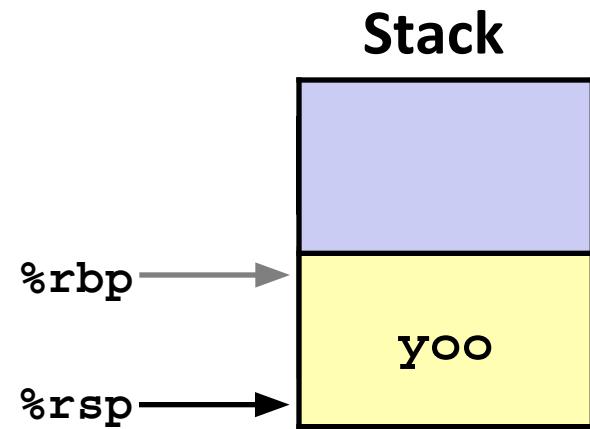

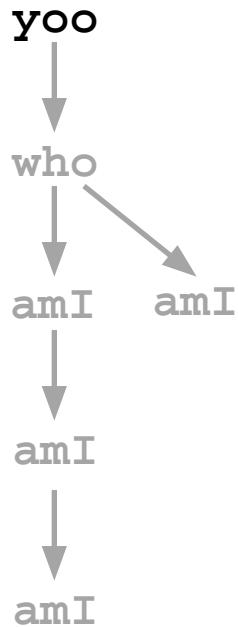

■ Management

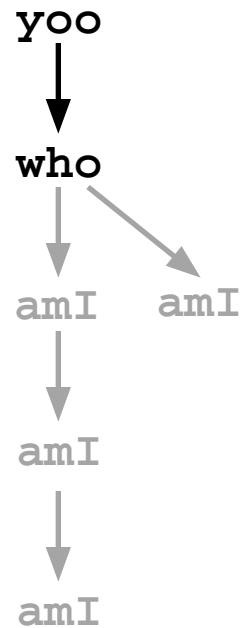

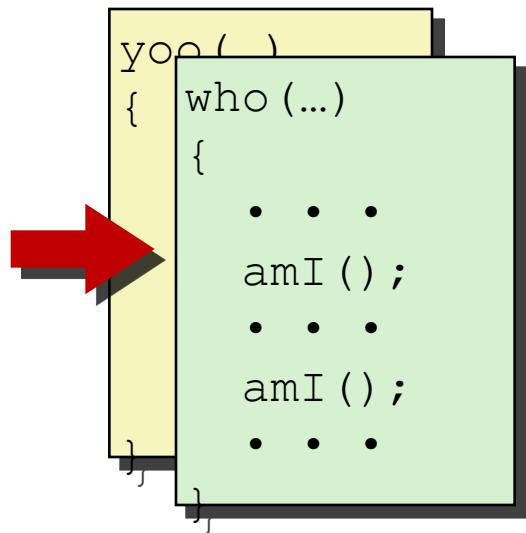

- Space allocated when enter procedure
 - “Set-up” code
 - Includes push by `call` instruction
- Deallocated when return
 - “Finish” code
 - Includes pop by `ret` instruction

Example

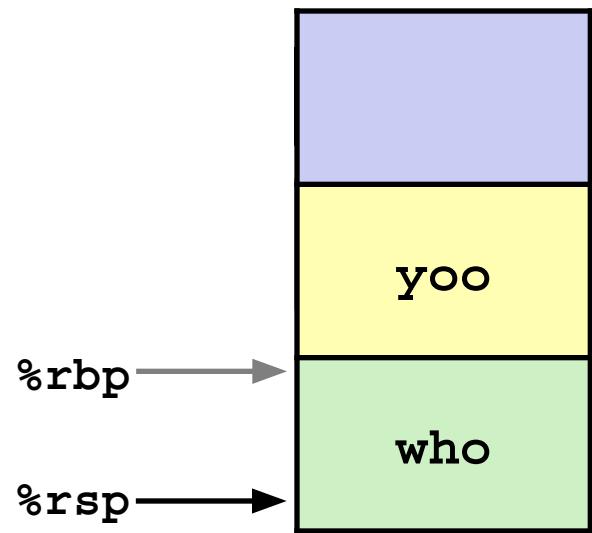

```
yoo (...)  
{  
    •  
    •  
    who () ;  
    •  
    •  
}
```

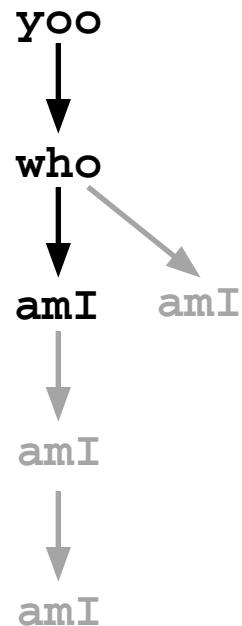

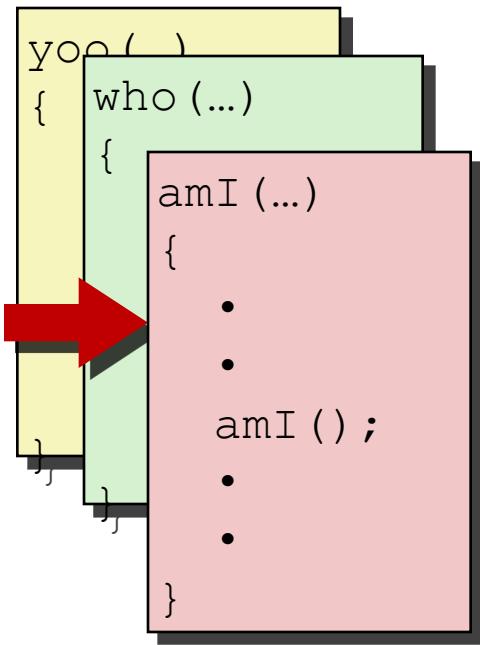

Example

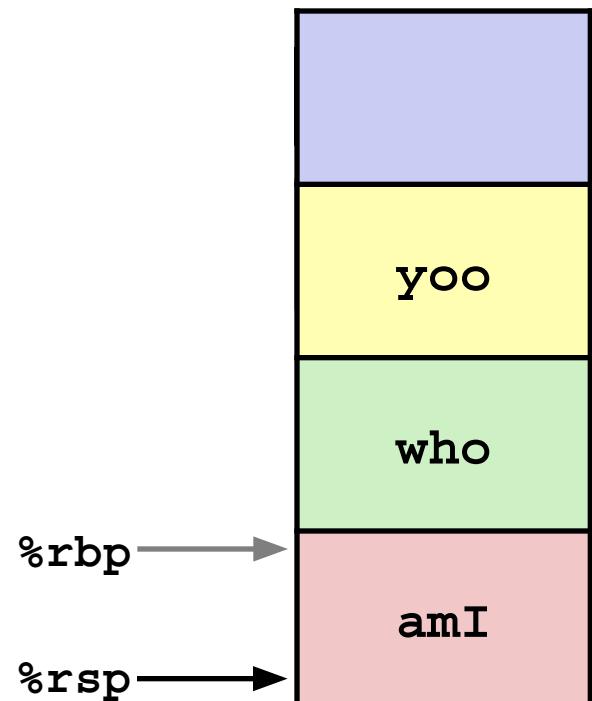

Stack

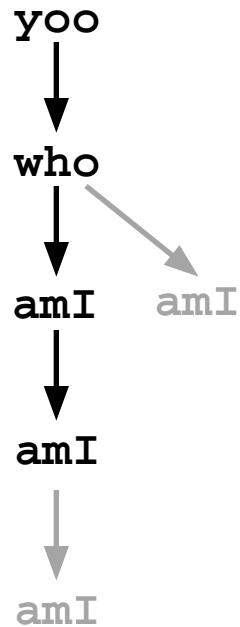

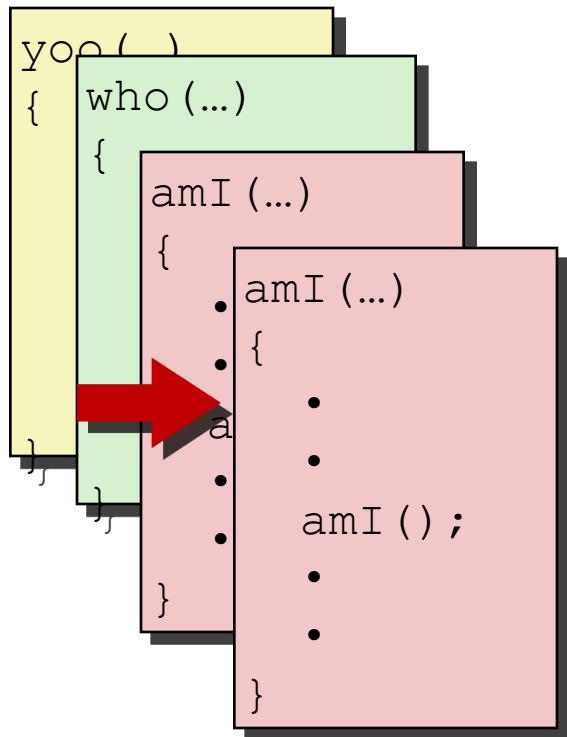

Example

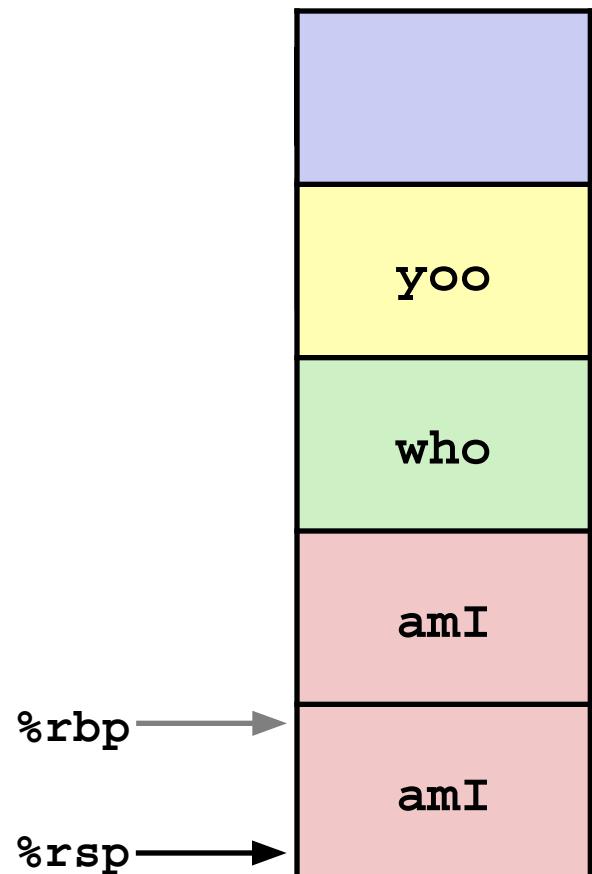

Stack

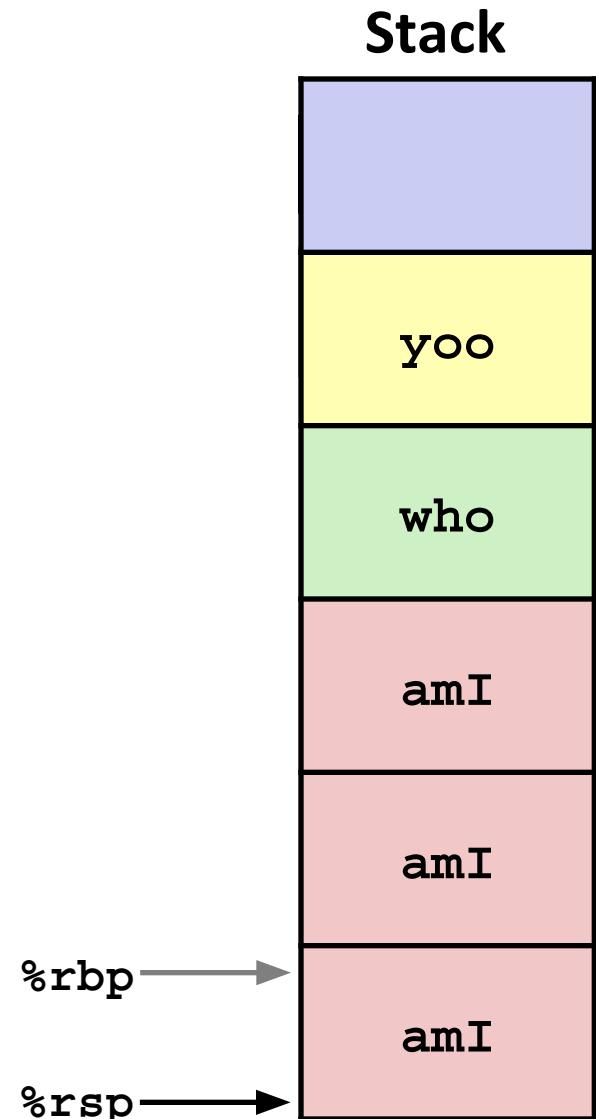

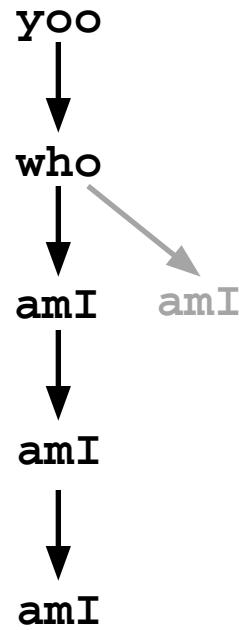

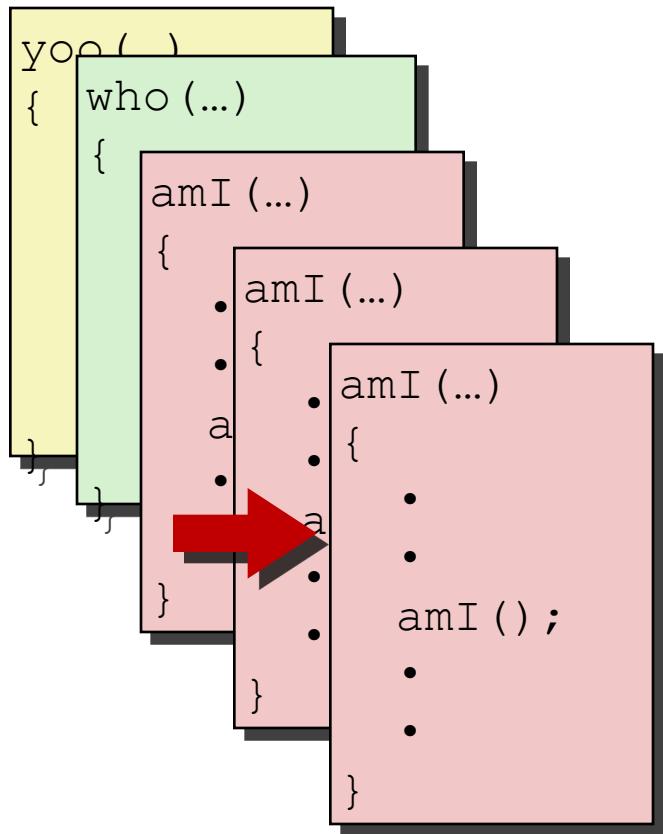

Example

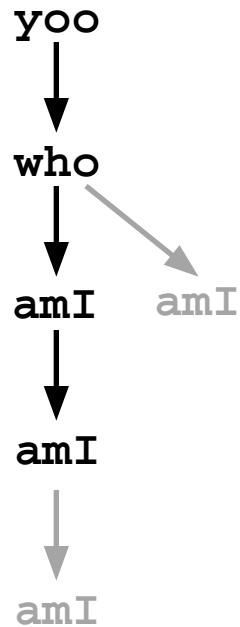

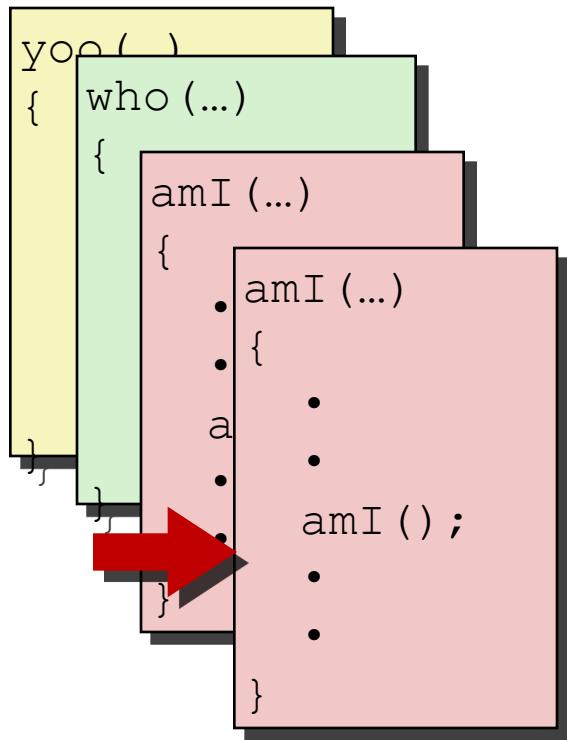

Stack

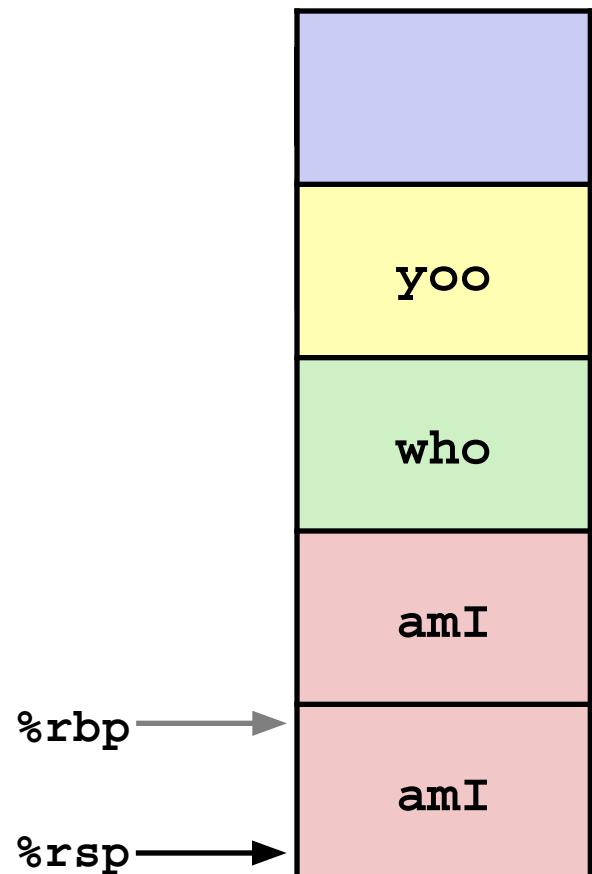

Example

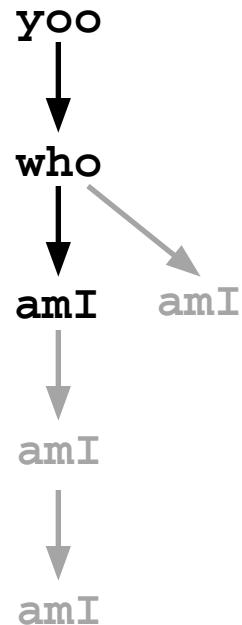

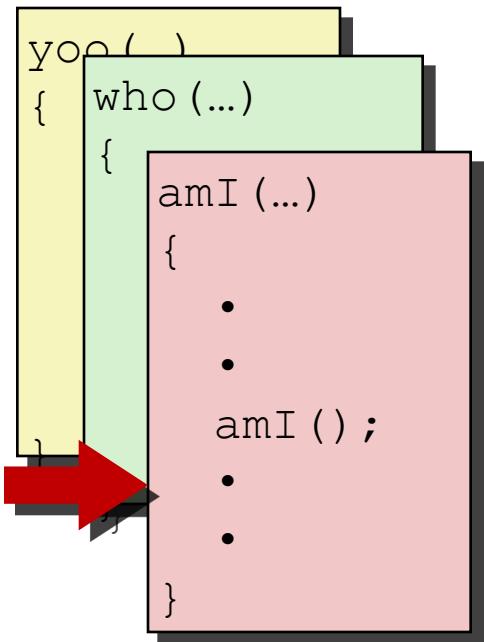

Example

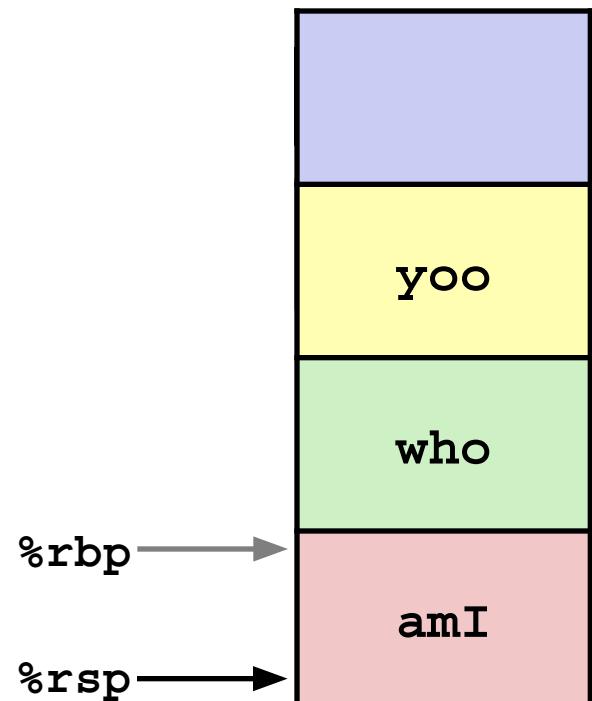

Stack

Example

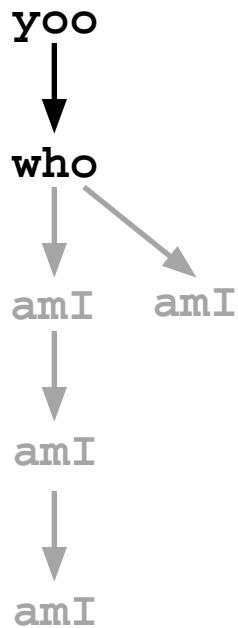

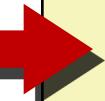

Stack

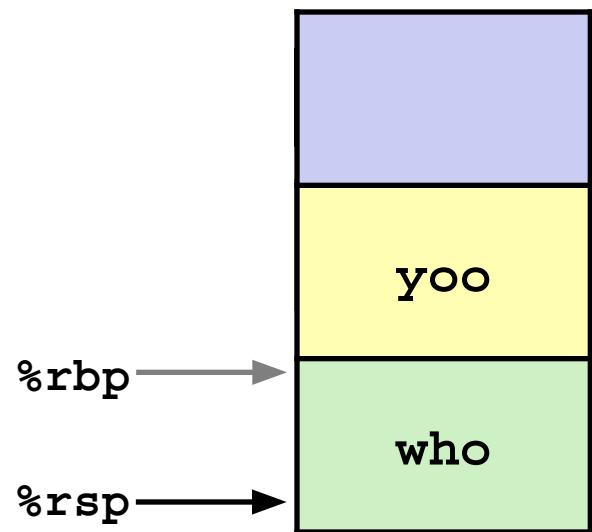

Example

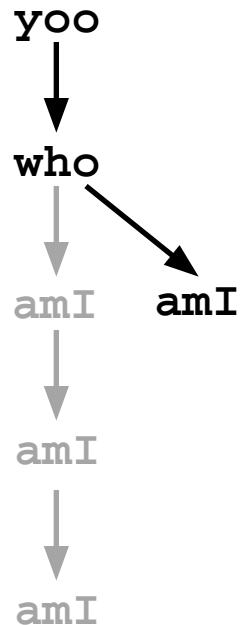

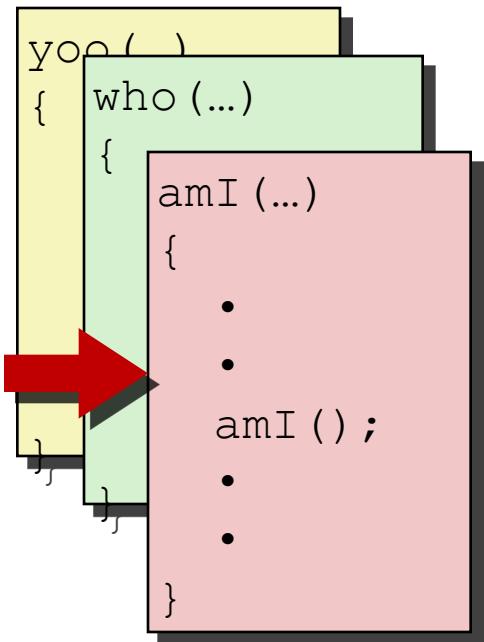

```
yoo( )  
{    who( ... )  
    {  
        . . .  
        amI();  
        . . .  
        amI();  
        . . .  
    }  
}
```

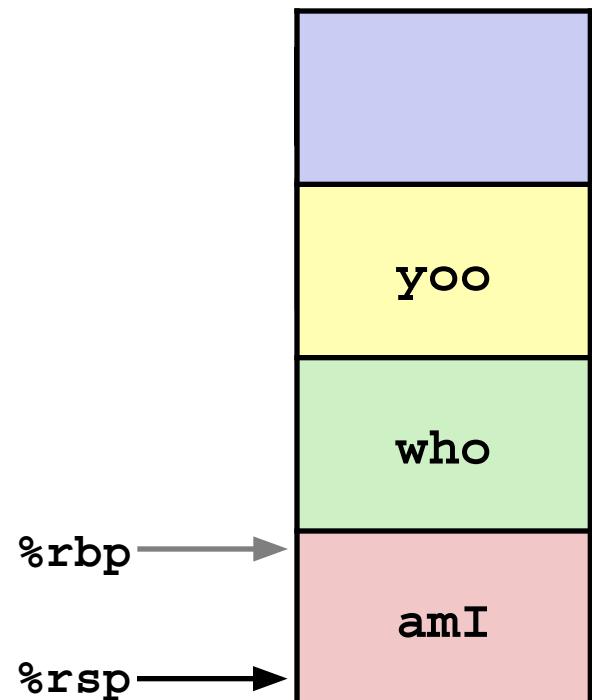

Stack

Example

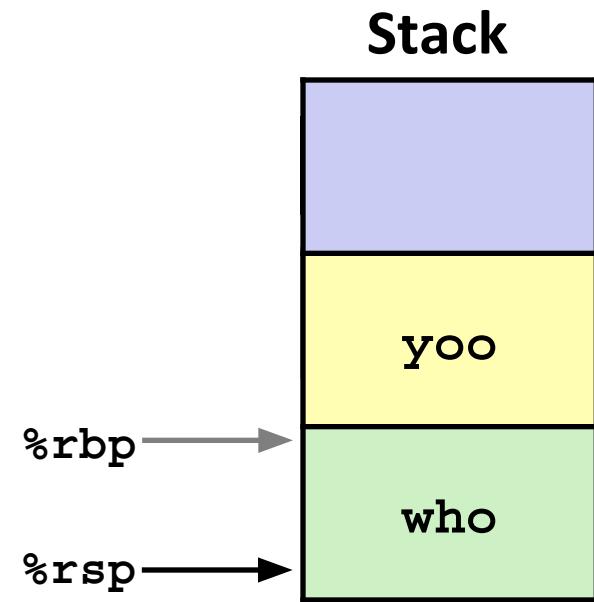

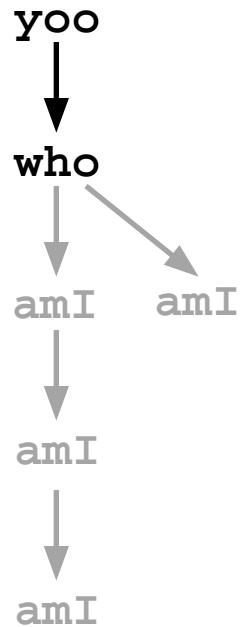

Stack

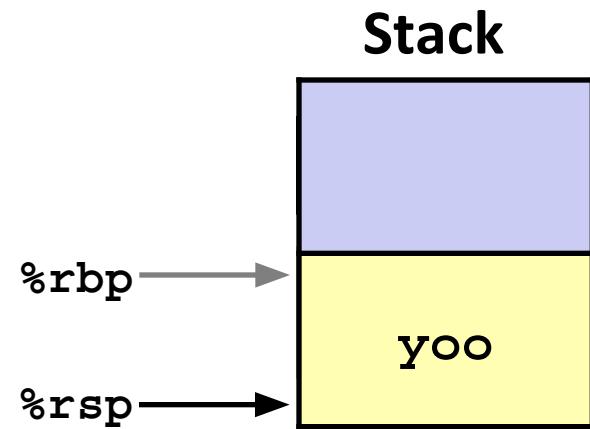

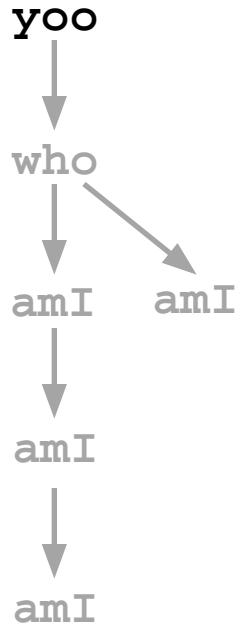

Example

```
yoo( )  
{    who( ... )  
{        . . .  
        amI( );  
        . . .  
        amI( );  
        . . .  
    }  
}
```

Example

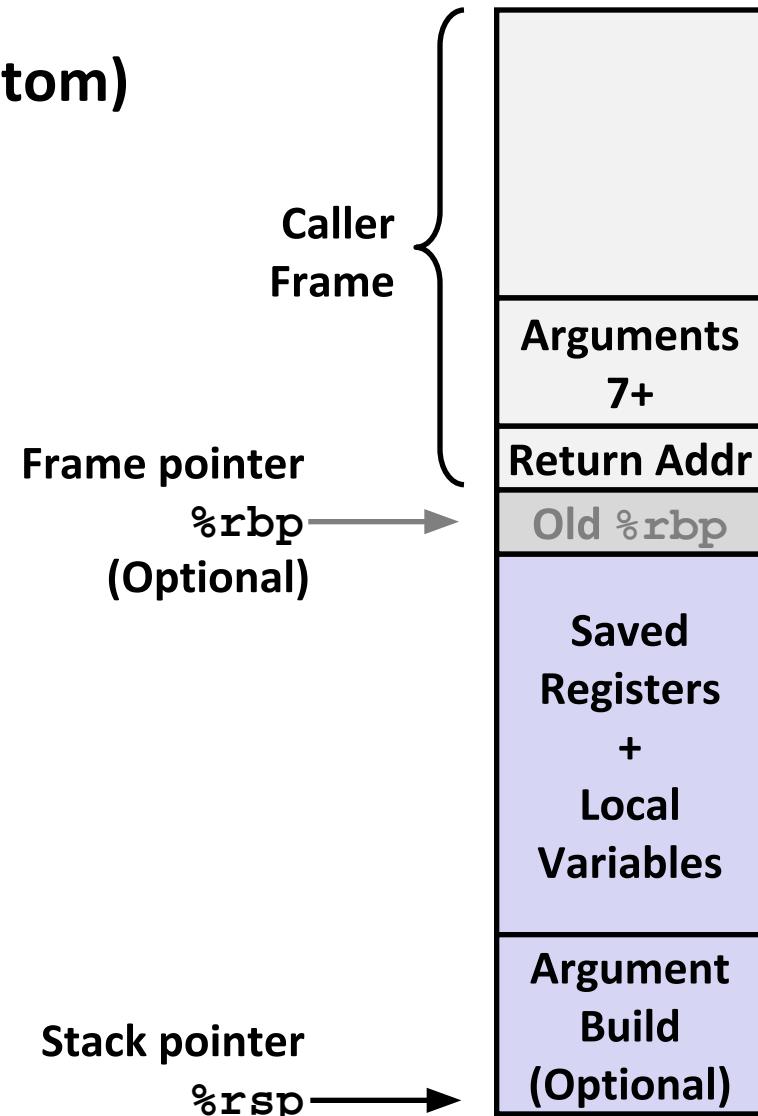

```
yoo (...)  
{  
    •  
    •  
    who () ;  
    •  
    •  
}
```

x86-64/Linux Stack Frame

■ Current Stack Frame (“Top” to Bottom)

- “Argument build:”
Parameters for function about to call
- Local variables
If can’t keep in registers
- Saved register context
- Old frame pointer (optional)

■ Caller Stack Frame

- Return address
 - Pushed by `call` instruction
- Arguments for this call

Example: incr

```
long incr(long *p, long val) {  
    long x = *p;  
    long y = x + val;  
    *p = y;  
    return x;  
}
```

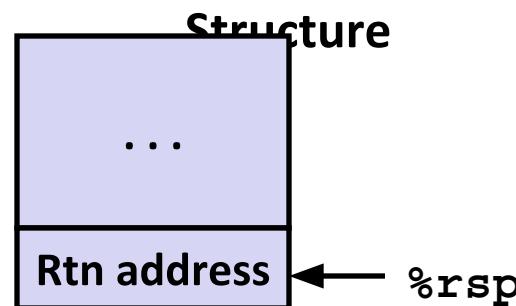

```
incr:  
    movq    (%rdi), %rax  
    addq    %rax, %rsi  
    movq    %rsi, (%rdi)  
    ret
```

Register	Use(s)
%rdi	Argument p
%rsi	Argument val , y
%rax	x , Return value

Example: Calling `incr` #1

```
long call_incr() {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return v1+v2;
}
```

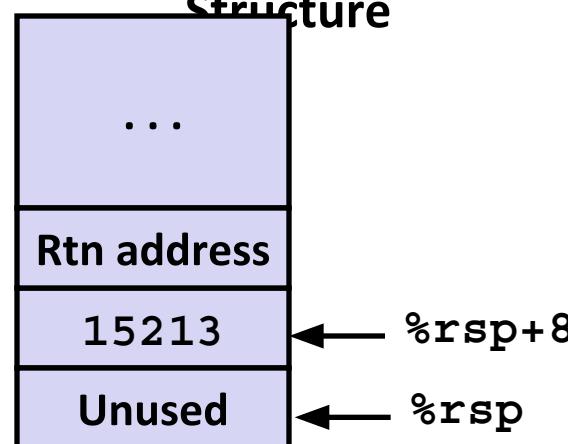

Initial Stack

`call_incr:`

```
subq    $16, %rsp
movq    $15213, 8(%rsp)
movl    $3000, %esi
leaq    8(%rsp), %rdi
call    incr
addq    8(%rsp), %rax
addq    $16, %rsp
ret
```

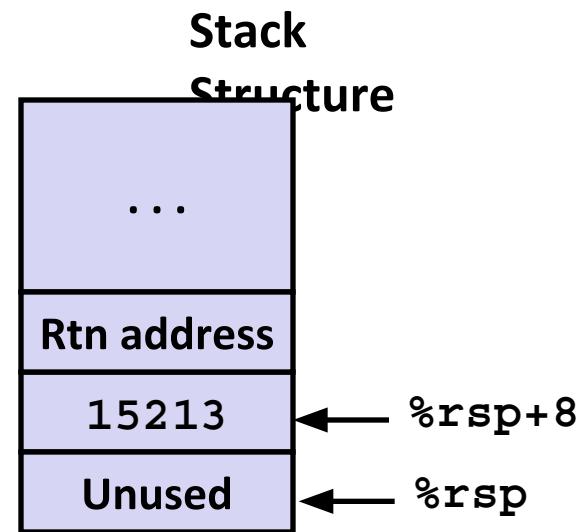

Resulting Stack

Example: Calling `incr` #2

```
long call_incr() {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return v1+v2;
}
```

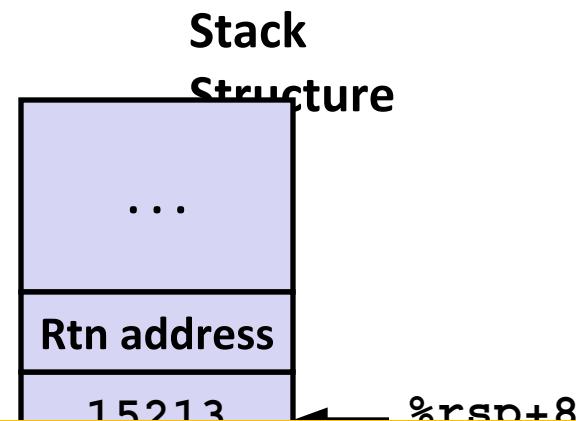

```
call_incr:
    subq    $16, %rsp
    movq    $15213, 8(%rsp)
    movl    $3000, %esi
    leaq    8(%rsp), %rdi
    call    incr
    addq    8(%rsp), %rax
    addq    $16, %rsp
    ret
```

Register	Use(s)
%rdi	&v1
%rsi	3000

Example: Calling incr #2

```
long call_incr() {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return v1+v2;
}
```

Aside 1: `movl $3000, %esi`

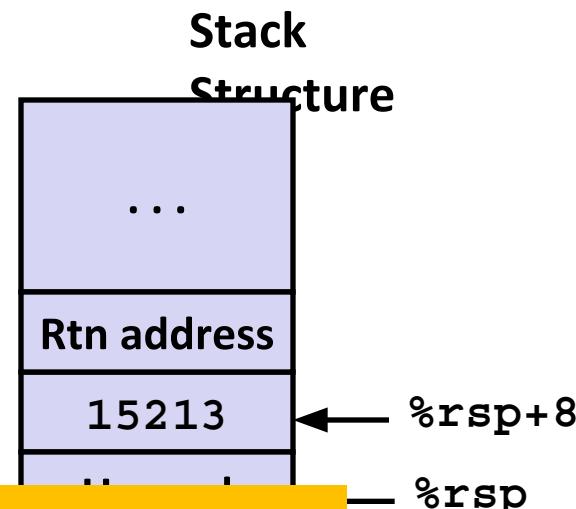

- Remember, `movl` -> `%exx` zeros out high order 32 bits.
- Why use `movl` instead of `movq`? 1 byte shorter.

```
movl    $3000, %esi
leaq    8(%rsp), %rdi
call    incr
addq    8(%rsp), %rax
addq    $16, %rsp
ret
```

<code>%rdi</code>	<code>&v1</code>
<code>%rsi</code>	3000

Example: Calling `incr` #2

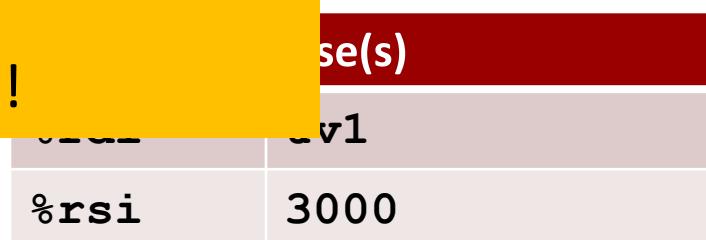

```
long call_incr() {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return v1+v2;
}
```

Aside 2: `leaq 8(%rsp), %rdi`

- Computes `%rsp+8`
- Actually, used for what it is meant!

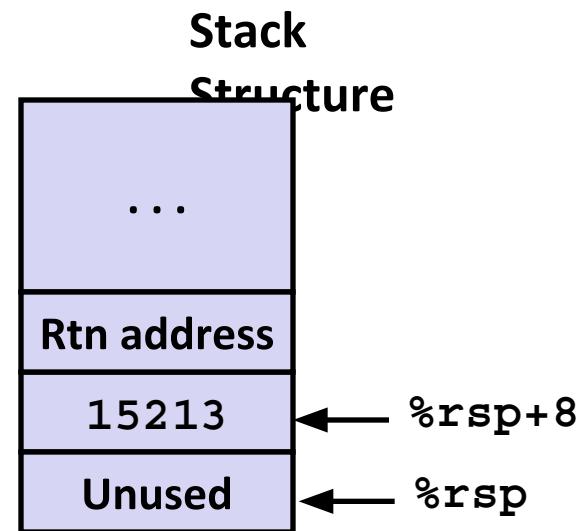

```
leaq    8(%rsp), %rdi
call   incr
addq    8(%rsp), %rax
addq    $16, %rsp
ret
```

Example: Calling `incr` #2

```
long call_incr() {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return v1+v2;
}
```

```
call_incr:
    subq    $16, %rsp
    movq    $15213, 8(%rsp)
    movl    $3000, %esi
    leaq    8(%rsp), %rdi
    call    incr
    addq    8(%rsp), %rax
    addq    $16, %rsp
    ret
```

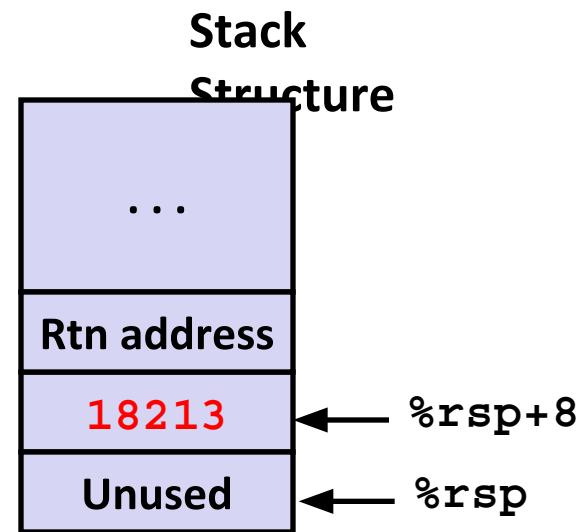

Register	Use(s)
%rdi	&v1
%rsi	3000

Example: Calling `incr` #3

```
long call_incr() {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return v1+v2;
}
```

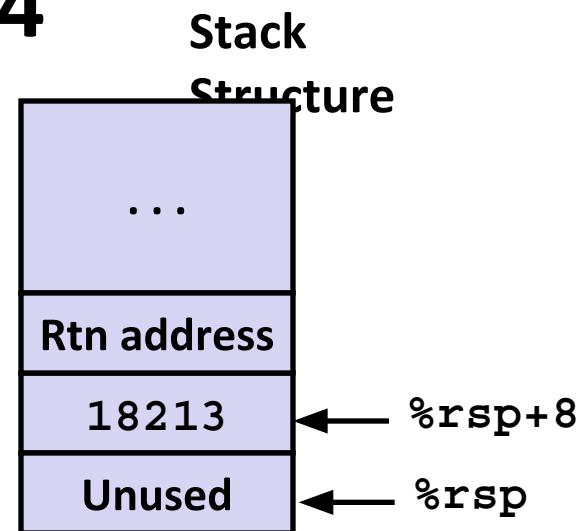

```
call_incr:
    subq    $16, %rsp
    movq    $15213, 8(%rsp)
    movl    $3000, %esi
    leaq    8(%rsp), %rdi
    call    incr
    addq    8(%rsp), %rax
    addq    $16, %rsp
    ret
```

Register	Use(s)
%rdi	&v1
%rsi	3000

Example: Calling `incr` #4

```
long call_incr() {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return v1+v2;
}
```

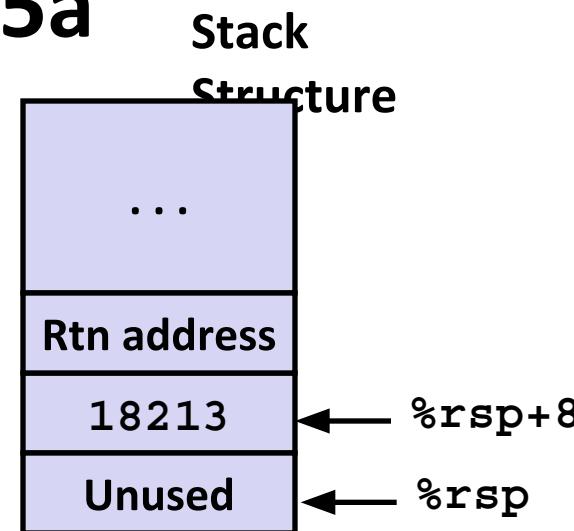

```
call_incr:
    subq    $16, %rsp
    movq    $15213, 8(%rsp)
    movl    $3000, %esi
    leaq    8(%rsp), %rdi
    call    incr
    addq    8(%rsp), %rax
    addq    $16, %rsp
    ret
```

Register	Use(s)
%rax	Return value

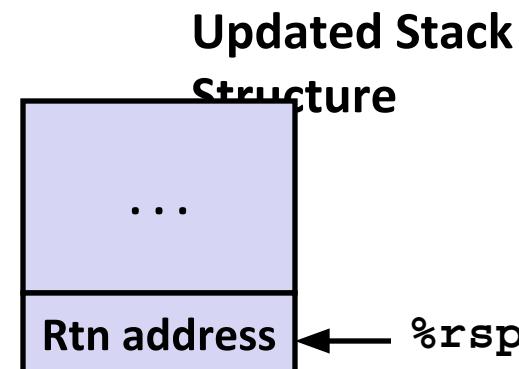

Example: Calling `incr` #5a

```
long call_incr() {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return v1+v2;
}
```

```
call_incr:
    subq    $16, %rsp
    movq    $15213, 8(%rsp)
    movl    $3000, %esi
    leaq    8(%rsp), %rdi
    call    incr
    addq    8(%rsp), %rax
    addq    $16, %rsp
    ret
```

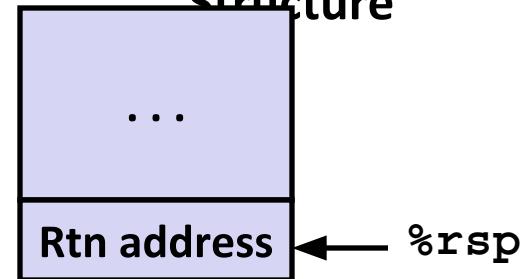

Register	Use(s)
%rax	Return value

Example: Calling `incr` #5b

```
long call_incr() {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return v1+v2;
}
```

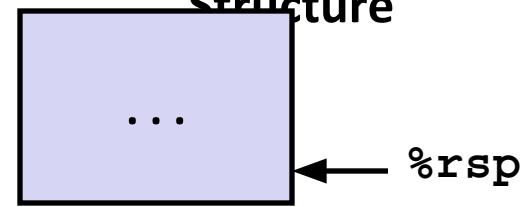

Updated Stack
Structure

```
call_incr:
    subq    $16, %rsp
    movq    $15213, 8(%rsp)
    movl    $3000, %esi
    leaq    8(%rsp), %rdi
    call    incr
    addq    8(%rsp), %rax
    addq    $16, %rsp
    ret
```

Register	Use(s)
%rax	Return value

Final Stack
Structure

Register Saving Conventions

■ When procedure `yoo` calls `who`:

- `yoo` is the *caller*
- `who` is the *callee*

■ Can register be used for temporary storage?

```
yoo:
```

```
• • •  
    movq $15213, %rdx  
    call who  
    addq %rdx, %rax  
• • •  
    ret
```

```
who:
```

```
• • •  
    subq $18213, %rdx  
• • •  
    ret
```

- Contents of register `%rdx` overwritten by `who`
- This could be trouble → something should be done!
 - Need some coordination

Register Saving Conventions

- When procedure `yoo` calls `who`:
 - `yoo` is the *caller*
 - `who` is the *callee*
- Can register be used for temporary storage?
- Conventions
 - “*Caller Saved*”
 - Caller saves temporary values in its frame before the call
 - “*Callee Saved*”
 - Callee saves temporary values in its frame before using
 - Callee restores them before returning to caller

x86-64 Linux Register Usage #1

■ **%rax**

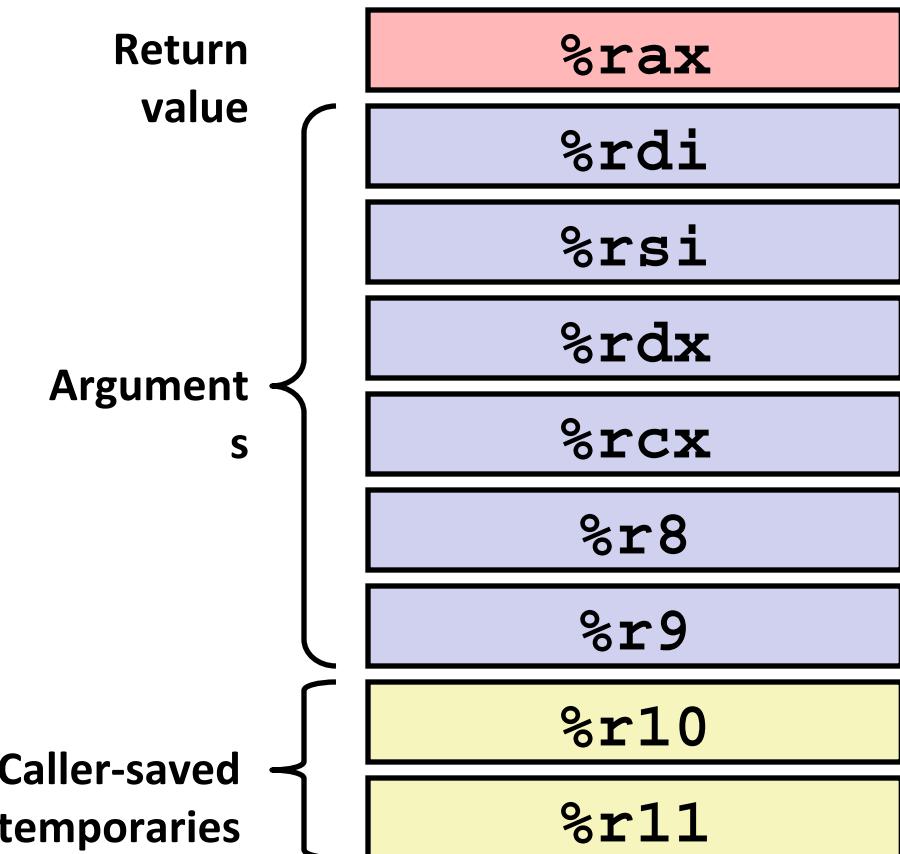

- Return value
- Also caller-saved
- Can be modified by procedure

■ **%rdi, ..., %r9**

- Arguments
- Also caller-saved
- Can be modified by procedure

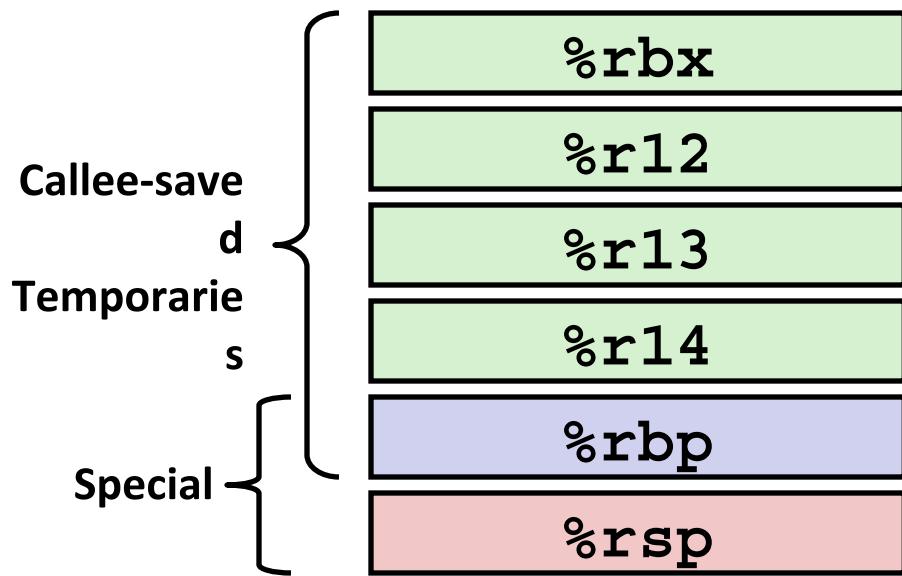

■ **%r10, %r11**

- Caller-saved
- Can be modified by procedure

x86-64 Linux Register Usage #2

- **%rbx, %r12, %r13, %r14**
 - Callee-saved
 - Callee must save & restore
- **%rbp**
 - Callee-saved
 - Callee must save & restore
 - May be used as frame pointer
 - Can mix & match
- **%rsp**
 - Special form of callee save
 - Restored to original value upon exit from procedure

Small Exercise

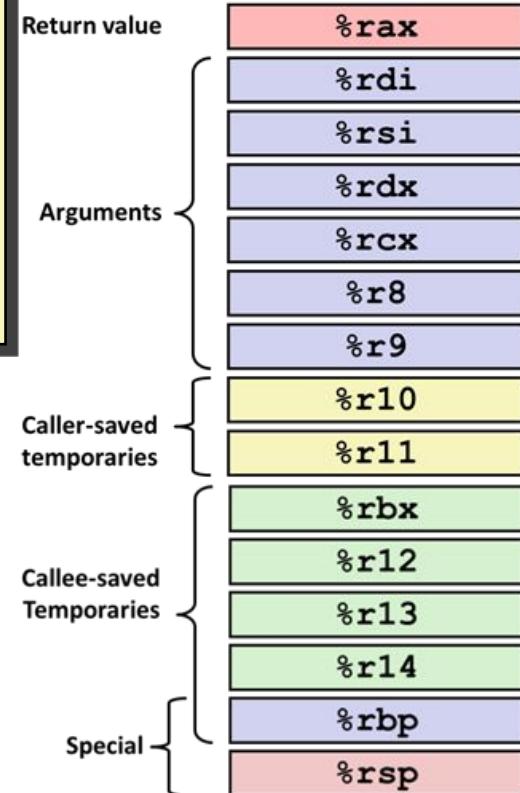

```
long add5(long b0, long b1, long b2, long b3, long b4) {
    return b0+b1+b2+b3+b4;
}

long add10(long a0, long a1, long a2, long a3, long a4, long a5,
           long a6, long a7, long a8, long a9) {
    return add5(a0, a1, a2, a3, a4) +
           add5(a5, a6, a7, a8, a9);
}
```

- Where are a_0, \dots, a_9 passed?
rdi, rsi, rdx, rcx, r8, r9, stack

- Where are b_0, \dots, b_4 passed?
rdi, rsi, rdx, rcx, r8

- Which registers do we need to save?
Ill-posed question. Need assembly.
rbx, rbp, r9 (during first call to add5)

Small Exercise

```
long add5(long b0, long b1, long b2, long b3, long b4) {
    return b0+b1+b2+b3+b4;
}

long add10(long a0, long a1, long a2, long a3, long a4, long a5,
           long a6, long a7, long a8, long a9) {
    return add5(a0, a1, a2, a3, a4) +
           add5(a5, a6, a7, a8, a9);
}
```

```
add10:
    pushq  %rbp
    pushq  %rbx
    movq   %r9, %rbp
    call   add5
    movq   %rax, %rbx
    movq   48(%rsp), %r8
    movq   40(%rsp), %rcx
    movq   32(%rsp), %rdx
    movq   24(%rsp), %rsi
    movq   %rbp, %rdi
    call   add5
    addq   %rbx, %rax
    popq   %rbx
    popq   %rbp
    ret
```

add5:

```
addq   %rsi, %rdi
addq   %rdi, %rdx
addq   %rdx, %rcx
leaq   (%rcx,%r8), %rax
ret
```

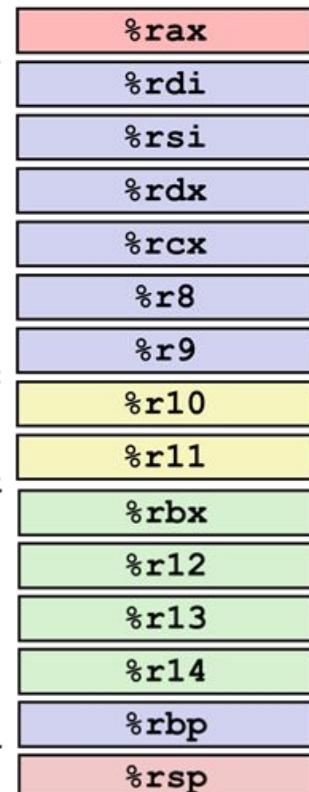

Return value

Arguments

Caller-saved
temporaries

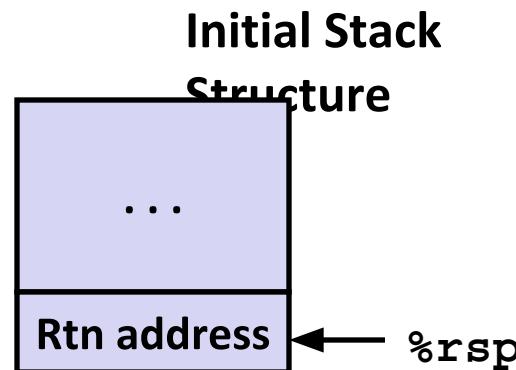

Callee-saved
Temporaries

Special

Callee-Saved Example #1

```
long call_incr2(long x) {  
    long v1 = 15213;  
    long v2 = incr(&v1, 3000);  
    return x+v2;  
}
```

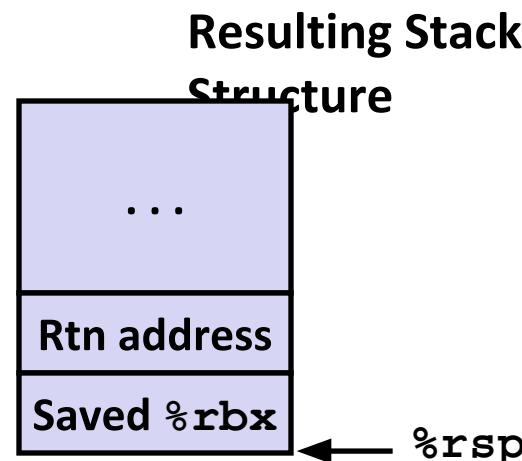

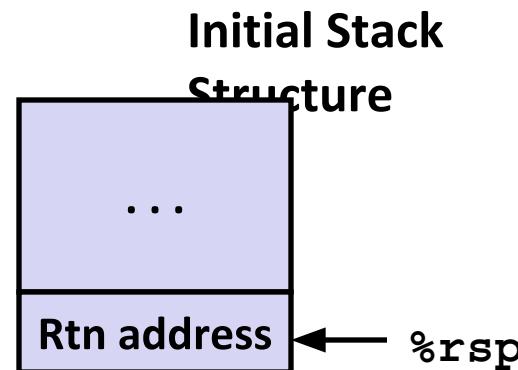

- X comes in register **%rdi**.
- We need **%rdi** for the call to incr.
- Where should be put x, so we can use it after the call to incr?

Callee-Saved Example #2

```
long call_incr2(long x) {  
    long v1 = 15213;  
    long v2 = incr(&v1, 3000);  
    return x+v2;  
}
```

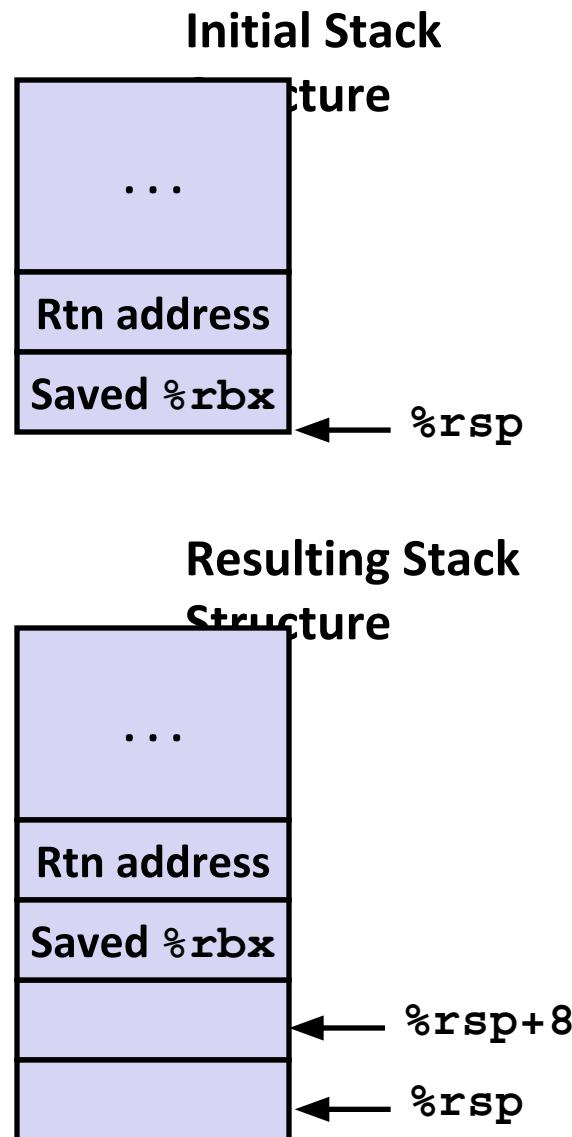

```
call_incr2:  
    pushq  %rbx  
    subq    $16, %rsp  
    movq    %rdi, %rbx  
    movq    $15213, 8(%rsp)  
    movl    $3000, %esi  
    leaq    8(%rsp), %rdi  
    call    incr  
    addq    %rbx, %rax  
    addq    $16, %rsp  
    popq    %rbx  
    ret
```

Callee-Saved Example #3

```
long call_incr2(long x) {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return x+v2;
}
```

```
call_incr2:
    pushq  %rbx
    subq    $16, %rsp
    movq    %rdi, %rbx
    movq    $15213, 8(%rsp)
    movl    $3000, %esi
    leaq    8(%rsp), %rdi
    call    incr
    addq    %rbx, %rax
    addq    $16, %rsp
    popq    %rbx
    ret
```

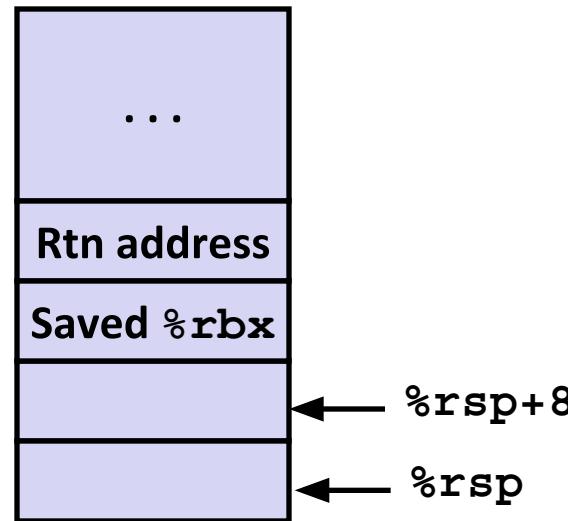

Callee-Saved Example #4

```
long call_incr2(long x) {  
    long v1 = 15213;  
    long v2 = incr(&v1, 3000);  
    return x+v2;  
}
```

```
call_incr2:  
    pushq  %rbx  
    subq    $16, %rsp  
    movq    %rdi, %rbx  
    movq    $15213, 8(%rsp)  
    movl    $3000, %esi  
    leaq    8(%rsp), %rdi  
    call    incr  
    addq    %rbx, %rax  
    addq    $16, %rsp  
    popq    %rbx  
    ret
```

Stack Structure

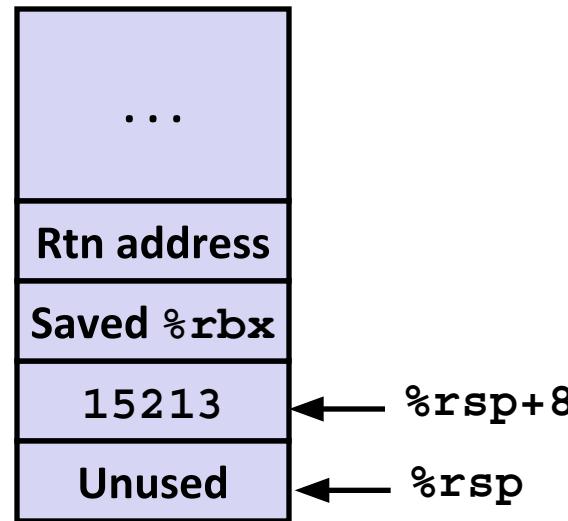

- X saved in **%rbx**.
- A callee saved register.

Callee-Saved Example #5

Stack Structure

```
long call_incr2(long x) {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return x+v2;
}
```

```
call_incr2:
    pushq  %rbx
    subq    $16, %rsp
    movq    %rdi, %rbx
    movq    $15213, 8(%rsp)
    movl    $3000, %esi
    leaq    8(%rsp), %rdi
    call    incr
    addq    %rbx, %rax
    addq    $16, %rsp
    popq    %rbx
    ret
```

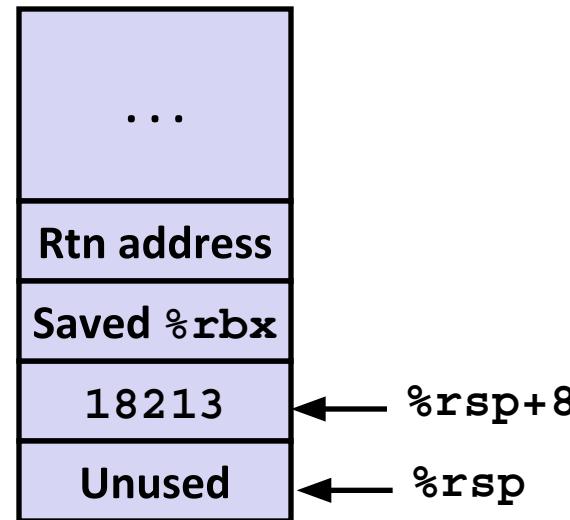

- X saved in **%rbx**.
- A callee saved register.

Callee-Saved Example #6

```
long call_incr2(long x) {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return x+v2;
}
```

```
call_incr2:
    pushq  %rbx
    subq    $16, %rsp
    movq    %rdi, %rbx
    movq    $15213, 8(%rsp)
    movl    $3000, %esi
    leaq    8(%rsp), %rdi
    call    incr
    addq    %rbx, %rax
    addq    $16, %rsp
    popq    %rbx
    ret
```

Stack Structure

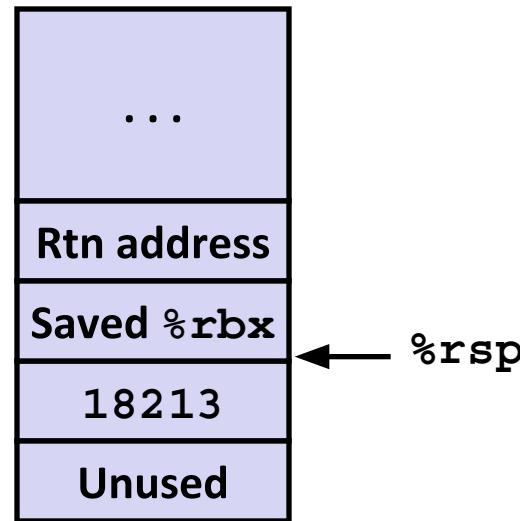

- X is safe in **%rbx**
- Return result in **%rax**

Callee-Saved Example #7

```
long call_incr2(long x) {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return x+v2;
}
```

```
call_incr2:
    pushq  %rbx
    subq    $16, %rsp
    movq    %rdi, %rbx
    movq    $15213, 8(%rsp)
    movl    $3000, %esi
    leaq    8(%rsp), %rdi
    call    incr
    addq    %rbx, %rax
    addq    $16, %rsp
    popq    %rbx
    ret
```

Stack Structure

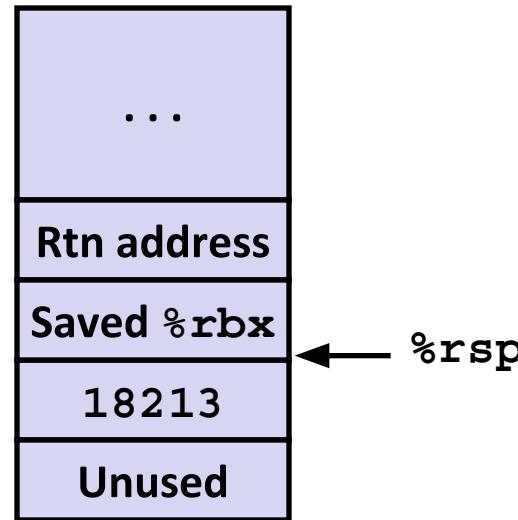

- Return result in **%rax**

Callee-Saved Example #8

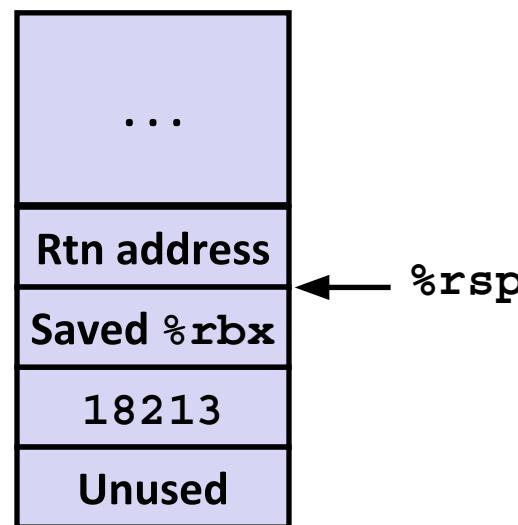

```
long call_incr2(long x) {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return x+v2;
}
```

```
call_incr2:
    pushq  %rbx
    subq    $16, %rsp
    movq    %rdi, %rbx
    movq    $15213, 8(%rsp)
    movl    $3000, %esi
    leaq    8(%rsp), %rdi
    call    incr
    addq    %rbx, %rax
    addq    $16, %rsp
    popq    %rbx
    ret
```

Initial Stack Structure

final Stack Structure

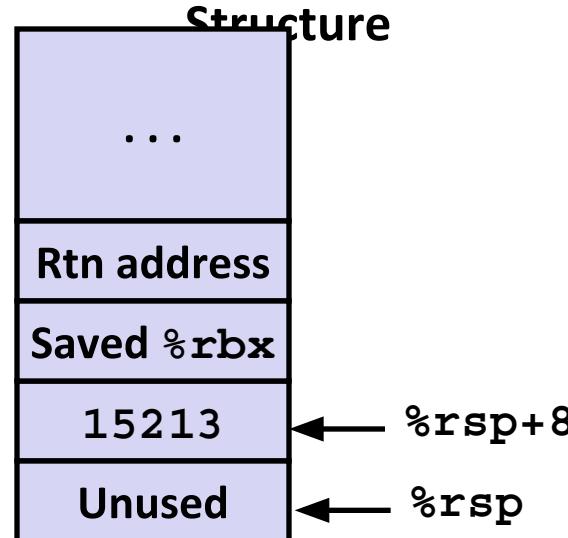

Callee-Saved Example #2

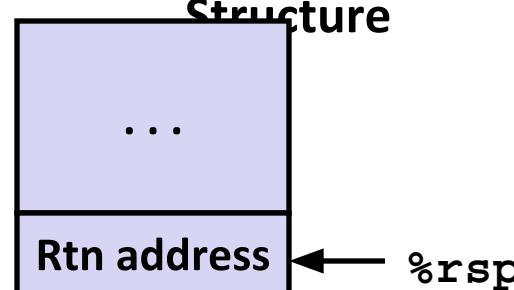

```
long call_incr2(long x) {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return x+v2;
}
```

```
call_incr2:
    pushq  %rbx
    subq    $16, %rsp
    movq    %rdi, %rbx
    movq    $15213, 8(%rsp)
    movl    $3000, %esi
    leaq    8(%rsp), %rdi
    call    incr
    addq    %rbx, %rax
    addq    $16, %rsp
    popq    %rbx
    ret
```

- Illustration of Recursion

Recursive Function

```
/* Recursive popcount */
long pcount_r(unsigned long x) {
    if (x == 0)
        return 0;
    else
        return (x & 1)
            + pcount_r(x >> 1);
}
```

pcount_r:

```
    movl    $0, %eax
    testq   %rdi, %rdi
    je      .L6
    pushq   %rbx
    movq   %rdi, %rbx
    andl   $1, %ebx
    shrq   %rdi
    call   pcount_r
    addq   %rbx, %rax
    popq   %rbx
.L6:
    rep; ret
```

Recursive Function Terminal Case

```
/* Recursive popcount */
long pcount_r(unsigned long x) {
    if (x == 0)
        return 0;
    else
        return (x & 1)
            + pcount_r(x >> 1);
}
```

<code>%rdi</code>	<code>x >> 1</code>	Rec. argument
<code>%rbx</code>	<code>x & 1</code>	Callee-saved

Recursive Function Call

```
/* Recursive popcount */
long pcount_r(unsigned long x) {
    if (x == 0)
        return 0;
    else
        return (x & 1)
            + pcount_r(x >> 1);
}
```

`pcount_r:`

```
    movl    $0, %eax
    testq   %rdi, %rdi
    je      .L6
    pushq   %rbx
    movq    %rdi, %rbx
    andl    $1, %ebx
    shrq    %rdi
    call    pcount_r
    addq    %rbx, %rax
    popq    %rbx
```

`.L6:`

```
    rep; ret
```

Register	Use(s)	Type
<code>%rbx</code>	<code>x & 1</code>	Callee-saved
<code>%rax</code>	Recursive call return value	

Recursive Function Result

```
/* Recursive popcount */
long pcount_r(unsigned long x) {
    if (x == 0)
        return 0;
    else
        return (x & 1)
            + pcount_r(x >> 1);
}
```

`pcount_r:`

```
    movl    $0, %eax
    testq   %rdi, %rdi
    je      .L6
    pushq   %rbx
    movq   %rdi, %rbx
    andl   $1, %ebx
    shrq   %rdi
    call   pcount_r
    addq   %rbx, %rax
    popq   %rbx
```

`.L6:`

```
    rep; ret
```

Register	Use(s)	Type
<code>%rbx</code>	<code>x & 1</code>	Callee-saved
<code>%rax</code>	Return value	

Recursive Function Completion

```
/* Recursive popcount */
long pcount_r(unsigned long x) {
    if (x == 0)
        return 0;
    else
        return (x & 1)
            + pcount_r(x >> 1);
}
```

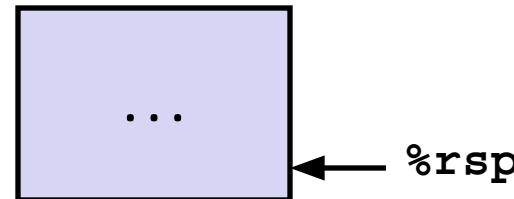

pcount_r:

```
    movl    $0, %eax
    testq   %rdi, %rdi
    je      .L6
    pushq   %rbx
    movq   %rdi, %rbx
    andl    $1, %ebx
    shrq   %rdi
    call    pcount_r
    addq   %rbx, %rax
    popq   %rbx
```

.L6:

rep; ret

Register	Use(s)	Type
%rax	Return value	Return value

Observations About Recursion

■ Handled Without Special Consideration

- Stack frames mean that each function call has private storage
 - Saved registers & local variables
 - Saved return pointer
- Register saving conventions prevent one function call from corrupting another's data
 - Unless the C code explicitly does so (e.g., buffer overflow in Lecture 9)
- Stack discipline follows call / return pattern
 - If P calls Q, then Q returns before P
 - Last-In, First-Out

■ Also works for mutual recursion

- P calls Q; Q calls P

x86-64 Procedure Summary

■ Important Points

- Stack is the right data structure for procedure call/return
 - If P calls Q, then Q returns before P

■ Recursion (& mutual recursion) handled by normal calling conventions

- Can safely store values in local stack frame and in callee-saved registers
- Put function arguments at top of stack
- Result return in **%rax**

■ Pointers are addresses of values

- On stack or global
