

Bits, Bytes, and Integers – Part 2

15-213/18-213/15-513/18-613: Introduction to Computer Systems 3rd Lecture, February 9, 2021

Summary From Last Lecture

- Representing information as bits
- Bit-level manipulations
- Integers
 - Representation: unsigned and signed
 - Conversion, casting
 - Expanding, truncating
 - Addition, negation, multiplication, shifting
- Representations in memory, pointers, strings
- Summary

Encoding Integers

Unsigned
$$B2U(X) = \sum_{i=0}^{w-1} x_i \cdot 2^i$$

Two's Complement

$$B2T(X) = -x_{w-1} \cdot 2^{w-1} + \sum_{i=0}^{w-2} x_i \cdot 2^i$$
Sign Bit

Two's Complement Examples (w = 5)

Unsigned & Signed Numeric Values

Χ	B2U(<i>X</i>)	B2T(<i>X</i>)
0000	0	0
0001	1	1
0010	2	2
0011	3	3
0100	4	4
0101	5	5
0110	6	6
0111	7	7
1000	8	-8
1001	9	- 7
1010	10	-6
1011	11	- 5
1100	12	-4
1101	13	-3
1110	14	-2
1111	15	-1

Equivalence

Same encodings for nonnegative values

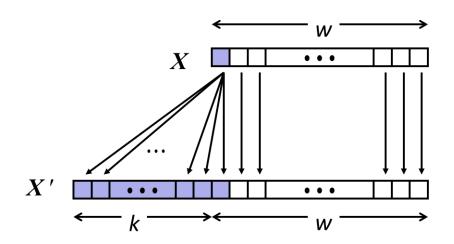

Uniqueness

- Every bit pattern represents unique integer value
- Each representable integer has unique bit encoding
- Expression containing signed and unsigned int:

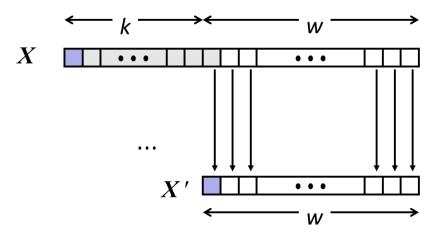

int is cast to unsigned

Sign Extension and Truncation

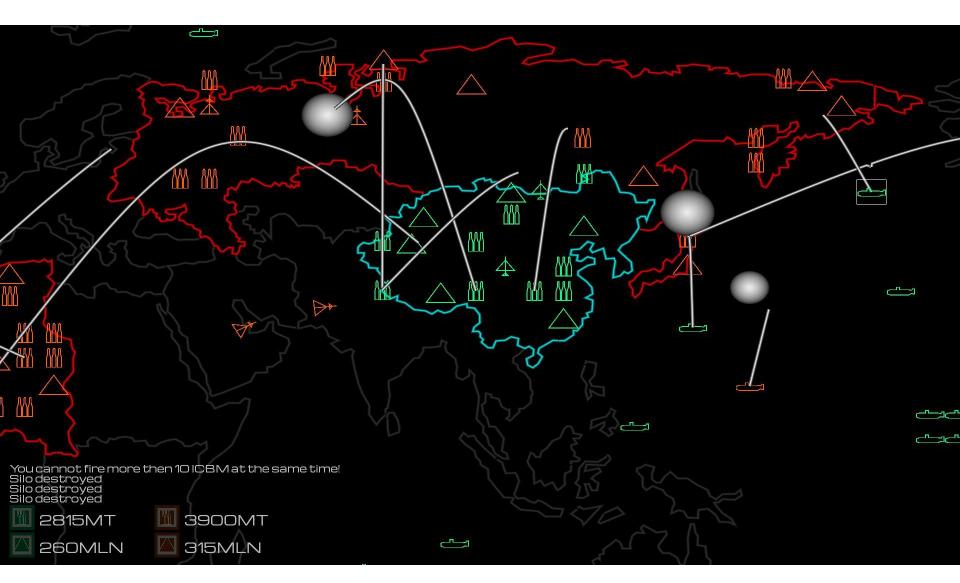

Sign Extension

Truncation

Global Thermonuclear War

- Misunderstanding integers can lead to the end of the world as we know it!
- Thule (Qaanaaq), Greenland
- US DoD "Site J" Ballistic Missile Early Warning System (BMEWS)
- 10/5/60: world nearly ends
- Missile radar echo: 1/8s
- BMEWS reports: 75s echo(!)
- 1000s of objects reported
- NORAD alert level 5:
 - Immediate incoming nuclear attack!!!!

- Kruschev was in NYC 10/5/60 (weird time to attack)
 - someone in Qaanaaq said "why not go check outside?"
- "Missiles" were actually THE MOON RISING OVER NORWAY
- Expected max distance: 3000 mi; Moon distance: .25M miles!
- .25M miles % sizeof(distance) = 2200mi.
- Overflow of distance nearly caused nuclear apocalypse!!

Today: Bits, Bytes, and Integers

- Representing information as bits
- Bit-level manipulations
- Integers
 - Representation: unsigned and signed
 - Conversion, casting
 - Expanding, truncating
 - Addition, negation, multiplication, shifting
- Representations in memory, pointers, strings
- Summary

Unsigned Addition

Operands: w bits

u

True Sum: w+1 bits

+ v •••

u+v

Discard Carry: w bits

 $UAdd_{w}(u, v)$

Standard Addition Function

- Ignores carry output
- Implements Modular Arithmetic

$$s = UAdd_w(u, v) = u + v \mod 2^w$$

unsigned char		1110	1001	E 9	223
	+	1101	0101	+ D5	+ 213
	1	1011	1110	1BE	446
		1011	1110	BE	190

Hex Decimanary

	•	•
0	0	0000
1	1	0001
2	2	0010
3	3	0011
4	4	0100
5	5	0101
6	6	0110
7	7	0111
8	8	1000
9	9	1001
A	10	1010
В	11	1011
U	12	1100
D	13	1101
E	14	1110
F	15	1111

Visualizing (Mathematical) Integer Addition

Integer Addition

- 4-bit integers u, v
- Compute true sum $Add_4(u, v)$
- Values increase linearly with u and v
- Forms planar surface

$Add_4(u, v)$

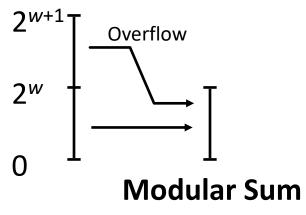

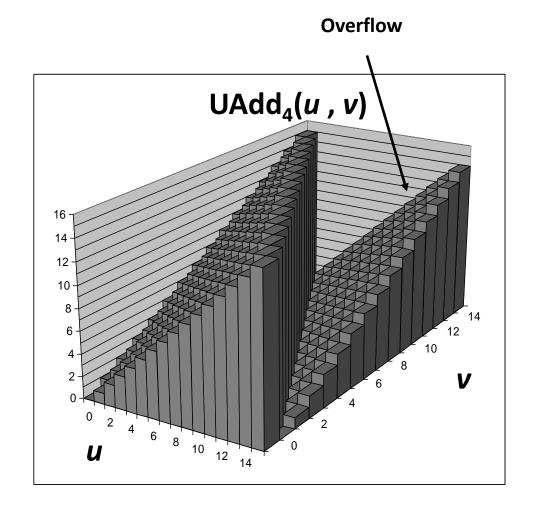

Visualizing Unsigned Addition

Wraps Around

- If true sum $\geq 2^w$
- At most once

True Sum

Two's Complement Addition

Operands: w bits

u

True Sum: w+1 bits

Discard Carry: w bits

 $TAdd_{w}(u, v)$

TAdd and UAdd have Identical Bit-Level Behavior

Signed vs. unsigned addition in C:

BE

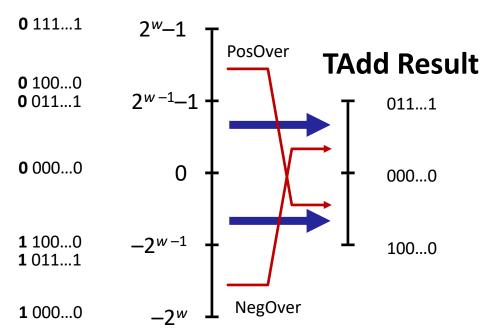

-66

TAdd Overflow

Functionality

- True sum requires w+1 bits
- Drop off MSB
- Treat remaining bits as 2's comp. integer

True Sum

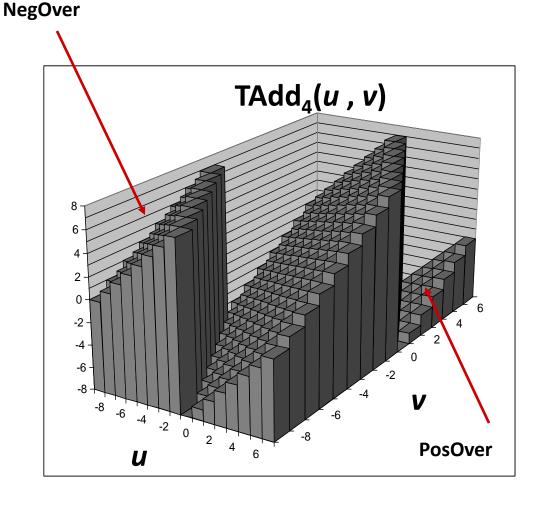

Visualizing 2's Complement Addition

Values

- 4-bit two's comp.
- Range from -8 to +7

Wraps Around

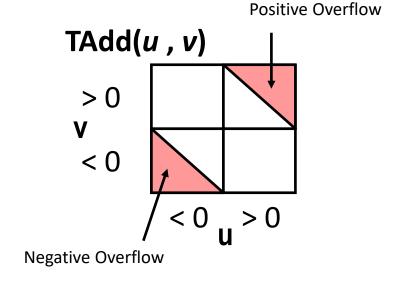

- If sum $\geq 2^{w-1}$
 - Becomes negative
 - At most once
- If sum $< -2^{w-1}$
 - Becomes positive
 - At most once

Characterizing TAdd

Functionality

- True sum requires w+1 bits
- Drop off MSB
- Treat remaining bits as 2's comp. integer

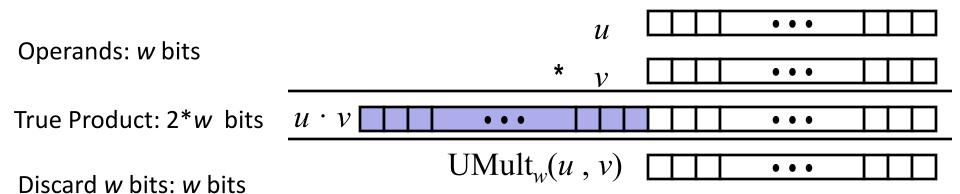

$$TAdd_{w}(u,v) = \begin{cases} u+v+2^{w} & u+v < TMin_{w} \text{ (NegOver)} \\ u+v & TMin_{w} \le u+v \le TMax_{w} \\ u+v-2^{w} & TMax_{w} < u+v \text{ (PosOver)} \end{cases}$$

Multiplication

- Goal: Computing Product of w-bit numbers x, y
 - Either signed or unsigned
- But, exact results can be bigger than w bits
 - Unsigned: up to 2w bits
 - Result range: $0 \le x * y \le (2^w 1)^2 = 2^{2w} 2^{w+1} + 1$
 - Two's complement min (negative): Up to 2w-1 bits
 - Result range: $x * y \ge (-2^{w-1})*(2^{w-1}-1) = -2^{2w-2} + 2^{w-1}$
 - Two's complement max (positive): Up to 2w bits, but only for $(TMin_w)^2$
 - Result range: $x * y \le (-2^{w-1})^2 = 2^{2w-2}$
- So, maintaining exact results...
 - would need to keep expanding word size with each product computed
 - is done in software, if needed
 - e.g., by "arbitrary precision" arithmetic packages

Unsigned Multiplication in C

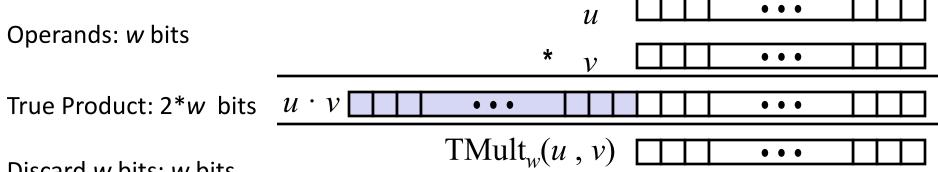

- Standard Multiplication Function
 - Ignores high order w bits
- Implements Modular Arithmetic

$$UMult_w(u, v) = u \cdot v \mod 2^w$$

		1110	1001		E9		233
*		1101	0101	*	D5	*	213
1100	0001	1101	1101	C1DD			49629
		1101	1101		DD		221

Signed Multiplication in C

Discard w bits: w bits

Standard Multiplication Function

- Ignores high order w bits
- Some of which are different for signed vs. unsigned multiplication
- Lower bits are the same

		1110	1001		E9		-23
*		1101	0101	*	D5	*	-43
0000	0011	1101	1101		03DD		989
		1101	1101		DD		-35

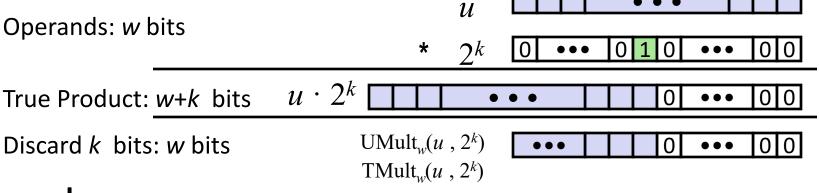

k

Power-of-2 Multiply with Shift

Operation

- u << k gives u * 2^k
- Both signed and unsigned

Operands: w bits

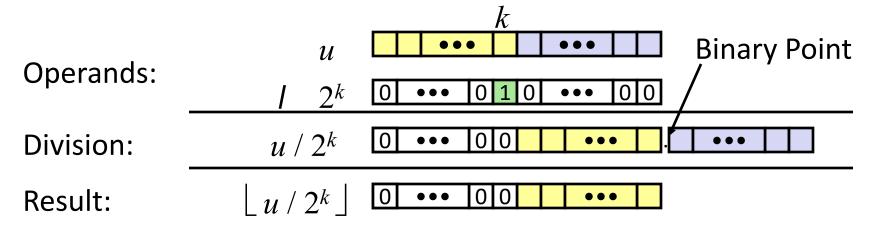

Examples

- 11 << 3
- (u << 5) (u << 3) ==
- Most machines shift and add faster than multiply
 - Compiler generates this code automatically

Unsigned Power-of-2 Divide with Shift

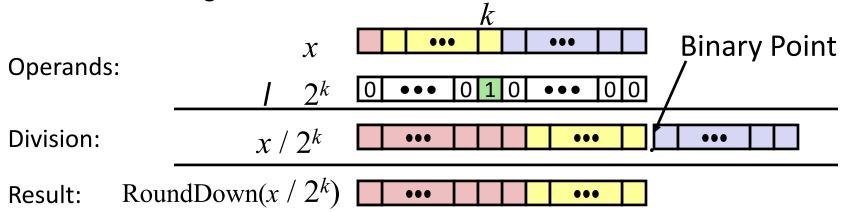

- Quotient of Unsigned by Power of 2
 - $\mathbf{u} \gg \mathbf{k}$ gives $\left[\mathbf{u} / 2^k \right]$
 - Uses logical shift

	Division	Computed	Hex	Binary		
x	15213	15213	3B 6D	00111011 01101101		
x >> 1	7606.5	7606	1D B6	00011101 10110110		
x >> 4	950.8125	950	03 B6	00000011 10110110		
x >> 8	59.4257813	59	00 3B	00000000 00111011		

Signed Power-of-2 Divide with Shift

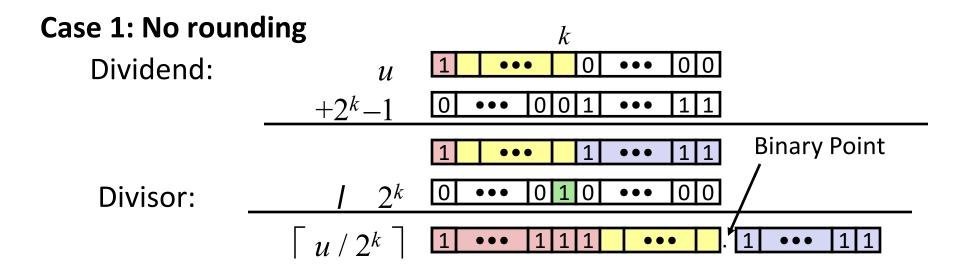

- Quotient of Signed by Power of 2
 - $x \gg k$ gives $\lfloor x / 2^k \rfloor$
 - Uses arithmetic shift
 - Rounds wrong direction when x < 0

	Division	Computed	Hex	Binary
x	-15213	-15213	C4 93	11000100 10010011
x >> 1	-7606.5	-7607	E2 49	1 1100010 01001001
x >> 4	-950.8125	-951	FC 49	1111 1100 01001001
x >> 8	-59.4257813	-60	FF C4	1111111 11000100

Correct Power-of-2 Divide

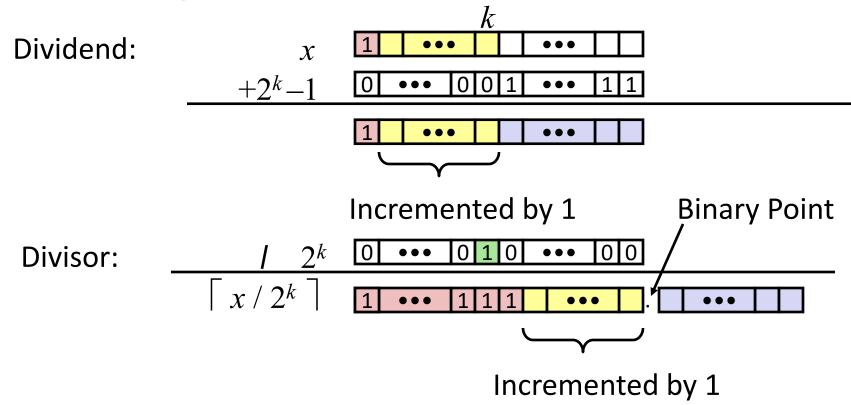

- Quotient of Negative Number by Power of 2
 - Want $\lceil \mathbf{x} / \mathbf{2}^k \rceil$ (Round Toward 0)
 - Compute as $\lfloor (x+2^k-1)/2^k \rfloor$
 - In C: (x + (1 << k) -1) >> k
 - Biases dividend toward 0

Biasing has no effect

Correct Power-of-2 Divide (Cont.)

Case 2: Rounding

Biasing adds 1 to final result

Negation: Complement & Increment

Negate through complement and increase

$$\sim x + 1 == -x$$

Example

• Observation: $\sim x + x == 1111...111 == -1$

$$x = 15213$$

	Decimal	He	X	Binary			
x	15213	3B	6D	00111011	01101101		
~x	-15214	C4	92	11000100	10010010		
~x+1	-15213	C4	93	11000100	10010011		
У	-15213	C4	93	11000100	10010011		

Complement & Increment Examples

$$x = 0$$

	Decimal	Hex	Binary		
0	0	00 00	0000000 00000000		
~0	-1	FF FF	11111111 11111111		
~0+1	0	00 00	0000000 00000000		

x = TMin

	Decimal	Hex	Binary		
x	-32768	80 00	10000000 000000000		
~x	32767	7F FF	01111111 11111111		
~x+1	-32768	80 00	10000000 00000000		

Canonical counter example

Today: Bits, Bytes, and Integers

- Representing information as bits
- Bit-level manipulations
- Integers
 - Representation: unsigned and signed
 - Conversion, casting
 - Expanding, truncating
 - Addition, negation, multiplication, shifting
 - Summary
- Representations in memory, pointers, strings

Arithmetic: Basic Rules

Addition:

- Unsigned/signed: Normal addition followed by truncate, same operation on bit level
- Unsigned: addition mod 2^w
 - Mathematical addition + possible subtraction of 2^w
- Signed: modified addition mod 2^w (result in proper range)
 - Mathematical addition + possible addition or subtraction of 2^w

Multiplication:

- Unsigned/signed: Normal multiplication followed by truncate, same operation on bit level
- Unsigned: multiplication mod 2^w
- Signed: modified multiplication mod 2^w (result in proper range)

Today: Bits, Bytes, and Integers

- Representing information as bits
- Bit-level manipulations
- Integers
 - Representation: unsigned and signed
 - Conversion, casting
 - Expanding, truncating
 - Addition, negation, multiplication, shifting
 - Summary
- Representations in memory, pointers, strings

Byte-Oriented Memory Organization

Programs refer to data by address

- Conceptually, envision it as a very large array of bytes
 - In reality, it's not, but can think of it that way
- An address is like an index into that array
 - and, a pointer variable stores an address

Note: system provides private address spaces to each "process"

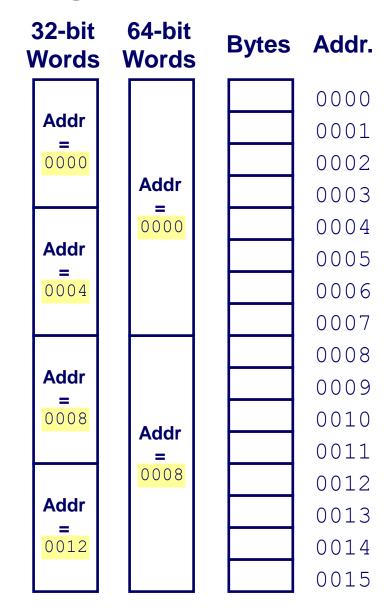

- Think of a process as a program being executed
- So, a program can clobber its own data, but not that of others

Machine Words

- Any given computer has a "Word Size"
 - Nominal size of integer-valued data
 - and of addresses
 - Until recently, most machines used 32 bits (4 bytes) as word size
 - Limits addresses to 4GB (2³² bytes)
 - Increasingly, machines have 64-bit word size
 - Potentially, could have 18 EB (exabytes) of addressable memory
 - That's 18.4 X 10¹⁸
 - Machines still support multiple data formats
 - Fractions or multiples of word size
 - Always integral number of bytes

Word-Oriented Memory Organization

- Addresses Specify Byte Locations
 - Address of first byte in word
 - Addresses of successive words differ by 4 (32-bit) or 8 (64-bit)

Example Data Representations

C Data Type	Typical 32-bit	Typical 64-bit	x86-64
char	1	1	1
short	2	2	2
int	4	4	4
long	4	8	8
float	4	4	4
double	8	8	8
pointer	4	8	8

Byte Ordering

- So, how are the bytes within a multi-byte word ordered in memory?
- Conventions
 - Big Endian: Sun (Oracle SPARC), PPC Mac, Internet
 - Least significant byte has highest address
 - Little Endian: x86, ARM processors running Android, iOS, and Linux
 - Least significant byte has lowest address

Byte Ordering Example

Example

- Variable x has 4-byte value of 0x01234567
- Address given by &x is 0x100

Big Endian			0x100	0x101	0x102	0 x 103	
			01	23	45	67	
Little Endian			0x100	0x101	0x102	0x103	
			67	45	23	01	

Representing Integers

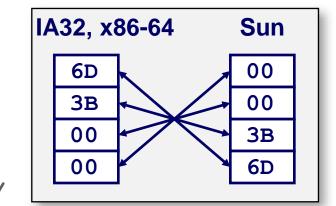

Decimal: 15213

Binary: 0011 1011 0110 1101

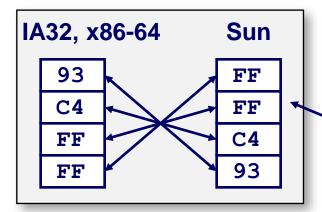

Hex: 3 B 6 D

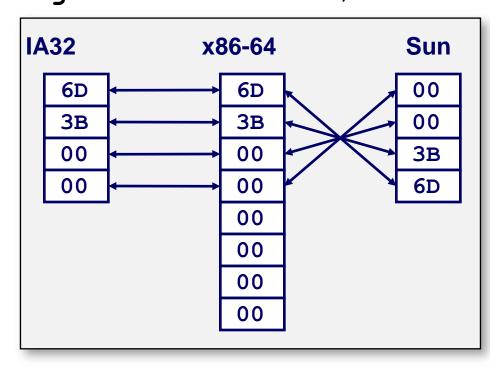

Increasing addresses

int B = -15213;

long int C = 15213;

Two's complement representation

Examining Data Representations

- Code to Print Byte Representation of Data
 - Casting pointer to unsigned char * allows treatment as a byte array

```
typedef unsigned char *pointer;

void show_bytes(pointer start, size_t len) {
    size_t i;
    for (i = 0; i < len; i++)
        printf("%p\t0x%.2x\n",start+i, start[i]);
    printf("\n");
}</pre>
```

Printf directives:

%p: Print pointer

%x: Print Hexadecimal

show_bytes Execution Example

```
int a = 15213;
printf("int a = 15213;\n");
show_bytes((pointer) &a, sizeof(int));
```

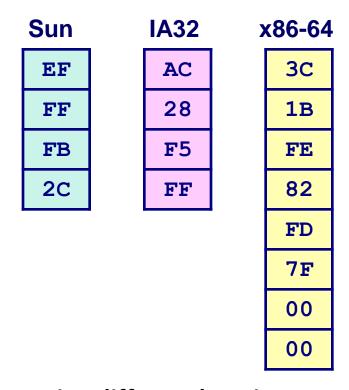

Result (Linux x86-64):

```
int a = 15213;
0x7fffb7f71dbc 6d
0x7fffb7f71dbd 3b
0x7fffb7f71dbe 00
0x7fffb7f71dbf 00
```

Representing Pointers

int
$$B = -15213;$$

int *P = &B

Different compilers & machines assign different locations to objects Even get different results each time run program

Representing Strings

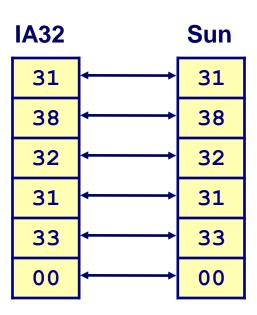

char S[6] = "18213";

Strings in C

- Represented by array of characters
- Each character encoded in ASCII format
 - Standard 7-bit encoding of character set
 - Character "0" has code 0x30
 - Digit i has code 0x30+i
- String should be null-terminated
 - Final character = 0

Compatibility

Byte ordering not an issue

Reading Byte-Reversed Listings

Disassembly

- Text representation of binary machine code
- Generated by program that reads the machine code

Example Fragment

Address	Instruction Code	Assembly Rendition
8048365:	5b	pop %ebx
8048366:	81 c3 ab 12 00 00	add \$0x12ab,%ebx
804836c:	83 bb 28 00 00 00 00	cmpl \$0x0,0x28(%ebx)

Deciphering Numbers

- Value:
- Pad to 32 bits:
- Split into bytes:
- Reverse:

```
0x12ab
0x000012ab
00 00 12 ab
ab 12 00 00
```

Summary

- Representing information as bits
- Bit-level manipulations
- Integers
 - Representation: unsigned and signed
 - Conversion, casting
 - Expanding, truncating
 - Addition, negation, multiplication, shifting
- Representations in memory, pointers, strings
- Summary
