

15-462 Computer Graphics I
Lecture 6

Hierarchical Models

Projections and Shadows
Hierarchical Models
Basic Animation
[Angel Ch 5.10, 9.1-9.6]

January 30, 2003
Frank Pfenning
Carnegie Mellon University

<http://www.cs.cmu.edu/~fp/courses/graphics/>

Roadmap

- Last lecture: Viewing and projection
- Today:
 - Shadows via projections
 - Hierarchical models
 - Basic animation
- Next: lighting and material properties
- Goal: background for Assignment 3 (next week)

01/30/2003

15-462 Graphics I

2

Shadow Algorithms

- With visibility tests
 - Accurate yet expensive
 - Example: ray casting or ray tracing
 - Example: 2-pass z-buffer
[Foley, Ch. 16.4.4] [RTR 6.12]
- Without visibility tests (“fake” shadows)
 - Approximate and inexpensive
 - Using projection in model-view matrix
 - Examples: flight simulator, Assignment 3

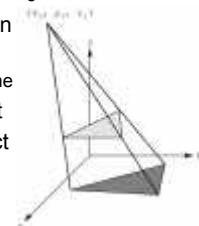

01/30/2003

15-462 Graphics I

3

Shadows via Projection

- Assume light source at $[x_l \ y_l \ z_l \ 1]^T$
- Assume shadow on plane $y = 0$
- Viewing ~ shadow projection
 - Center of projection ~ light
 - Viewing plane ~ shadow plane
- View plane in front of object
- Shadow plane behind object

01/30/2003

15-462 Graphics I

4

Shadow Projection Strategy

- Move light source to origin
- Apply appropriate projection matrix
- Move light source back
- Instance of general strategy: compose complex transformation from simpler ones!

$$T = \begin{bmatrix} 1 & 0 & 0 & -x_l \\ 0 & 1 & 0 & -y_l \\ 0 & 0 & 1 & -z_l \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

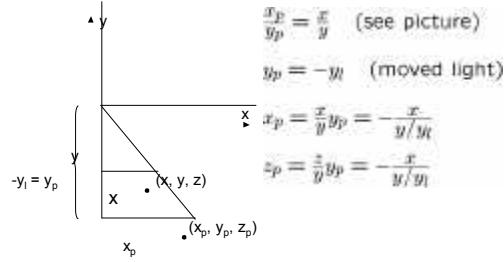

01/30/2003

15-462 Graphics I

5

Derive Equation

- Now, light source at origin

01/30/2003

15-462 Graphics I

6

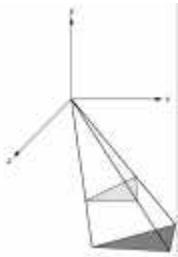

Light Source at Origin

- After translation, solve

$$M \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} = w \begin{bmatrix} -\frac{x}{y/w} \\ -\frac{y}{y/w} \\ -\frac{z}{y/w} \\ 1 \end{bmatrix}$$

- w can be chosen freely
- Use $w = -y/y_l$

$$M \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} = \begin{bmatrix} x \\ y \\ z \\ -y/y_l \end{bmatrix}$$

01/30/2003

15-462 Graphics I

7

Shadow Projection Matrix

- Solution of previous equation

$$M = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & -\frac{1}{w} & 0 & 0 \end{bmatrix}$$

- Total shadow projection matrix

$$S = T^{-1}MT = \dots$$

01/30/2003

15-462 Graphics I

8

Implementation

- Recall column-major form
- ```
GLfloat m[16] =
{1.0, 0.0, 0.0, 0.0,
 0.0, 1.0, 0.0, -1.0/y_l,
 0.0, 0.0, 1.0, 0.0,
 0.0, 0.0, 0.0, 0.0};
```
- Assume drawPolygon(); draws object

01/30/2003

15-462 Graphics I

9

## Saving State

- Assume xl, yl, zl hold light coordinates

```
glMatrixMode(GL_MODELVIEW);
drawPolygon(); /* draw normally */

glPushMatrix(); /* save current matrix */
glTranslatef(xl, yl, zl); /* translate back */
glMultMatrixf(m); /* project */
glTranslatef(-xl, -yl, -zl); /* move light to origin */
drawPolygon(); /* draw polygon again for shadow */
glPopMatrix(); /* restore original transformation */
...
```

01/30/2003

15-462 Graphics I

10

## The Matrix and Attribute Stacks

- Mechanism to save and restore state
  - glPushMatrix();
  - glPopMatrix();
- Apply to current matrix
- Can also save current attribute values
  - Examples: color, lighting
  - glPushAttrib(GLbitfield mask);
  - glPopAttrib();
  - Mask determines which attributes are saved

01/30/2003

15-462 Graphics I

11

## Drawing on a Surface

- Shimmering when drawing shadow on surface
- Due to limited precision depth buffer
- Either displace surface or shadow slightly (glPolygonOffset in OpenGL)
- Or use special properties of scene
- Or use general technique
  - Set depth buffer to read-only, draw surface
  - Set depth buffer to read-write, draw shadow
  - Set color buffer to read-only, draw surface again
  - Set color buffer to read-write

01/30/2003

15-462 Graphics I

12

## Outline

- Projections and Shadows
- Hierarchical Models
- Basic Animation

01/30/2003

15-462 Graphics I

13

## Hierarchical Models

- Many graphical objects are structured
- Exploit structure for
  - Efficient rendering
  - Example: bounding boxes (later in course)
  - Concise specification of model parameters
  - Example: joint angles
  - Physical realism
- Structure often naturally hierarchical

01/30/2003

15-462 Graphics I

14

## Instance Transformation

- Often we need several instances of an object
  - Wheels of a car
  - Arms or legs of a figure
  - Chess pieces
- Instances can be shared across space or time
- Encapsulate basic object in a function
- Object instances are created in “standard” form
- Apply transformations to different instances
- Typical order: scaling, rotation, translation

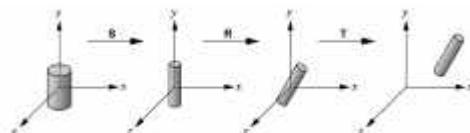

01/30/2003

15-462 Graphics I

15

## Sample Instance Transformation

```
glMatrixMode(GL_MODELVIEW);
glLoadIdentity();
glTranslatef(...);
glRotatef(...);
glScalef(...);
gluCylinder(...);
```

01/30/2003

15-462 Graphics I

16

## Display Lists

- Sharing display commands
- Display lists are stored on the server
- May contain drawing commands and transfsns.
- Initialization:

```
GLuint torus = glGenLists(1);
glNewList(torus, GL_COMPILE);
Torus(8, 25);
glEndList();
```
- Use: `glCallList(torus);`
- In animation, can also share at different times

01/30/2003

15-462 Graphics I

17

## Display Lists Caveats

- Store only values of expressions
- Display lists cannot be changed or updated
- Only store commands that change server state
- Effect of executing display list depends on current transformations and attributes
- Display lists may be hierarchical
  - One list may call another
  - Can be useful for hierarchical objects
  - Some implementation-dependent nesting limit

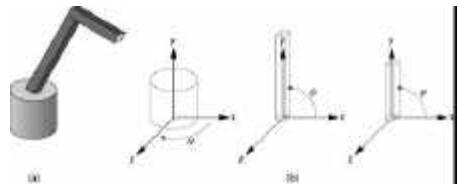

01/30/2003

15-462 Graphics I

18

## Drawing a Compound Object

- Example: simple “robot arm”

Base rotation  $\theta$ , arm angle  $\phi$ , joint angle  $\psi$

01/30/2003

15-462 Graphics I

19

## Interleave Drawing & Transformation

- $h1 = \text{height of base}$ ,  $h2 = \text{length of lower arm}$

```
void drawRobot(GLfloat theta, GLfloat phi, GLfloat psi)
{
 glRotatef(theta, 0.0, 1.0, 0.0);
 drawBase();
 glTranslatef(0.0, h1, 0.0);
 glRotatef(phi, 0.0, 0.0, 1.0);
 drawLowerArm();
 glTranslatef(0.0, h2, 0.0);
 glRotatef(psi, 0.0, 0.0, 1.0);
 drawUpperArm();
}
```

01/30/2003

15-462 Graphics I

20

## Assessment of Interleaving

- Compact
- Correct “by construction”
- Efficient
- Inefficient alternative:
 

```
glPushMatrix(); glPushMatrix(); ...etc...
glRotatef(theta, ...); glRotatef(theta, ...);
drawBase(); glTranslatef(...);
glPopMatrix(); glRotatef(phi, ...);
 drawLowerArm();
 glPopMatrix();
```
- Count number of transformations

01/30/2003

15-462 Graphics I

21

## Hierarchical Objects and Animation

- Drawing functions are time-invariant  
drawBase(); drawLowerArm(); drawUpperArm();
- Can be easily stored in display list
- Change parameters of model with time
- Redraw when idle callback is invoked

01/30/2003

15-462 Graphics I

22

## A Bug to Watch

```
GLfloat theta = 0.0; /* update in idle callback */
GLfloat phi = 0.0; /* update in idle callback */
GLuint arm = glGenLists(1);
/* in init function */
glNewList(arm, GL_COMPILE);
 glRotatef(theta, 0.0, 1.0, 0.0);
 drawBase();
...
 drawUpperArm(); What is wrong?
glEndList();
/* in display callback */
glCallList(arm);
```

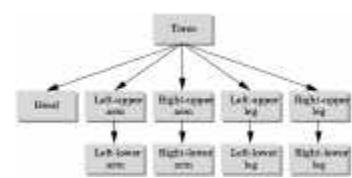

01/30/2003

15-462 Graphics I

23

## More Complex Objects

- Tree rather than linear structure
- Interleave along each branch
- Use push and pop to save state

01/30/2003

15-462 Graphics I

24

## Hierarchical Tree Traversal

- Order not necessarily fixed

- Example:

```
void drawFigure() glPushMatrix();
{ glTranslatef(...);
 glPushMatrix(); /* save */ glRotatef(...);
 drawTorso(); drawUpperArm();
 glTranslatef(...); /* move head */ glTranslatef(...)
 glRotatef(...); /* rotate head */ glRotatef(...);
 drawHead(); drawLowerArm();
 glPopMatrix(); /* restore */ glPopMatrix();
 ... }
```

01/30/2003

15-462 Graphics I

25

## Using Tree Data Structures

- Can make tree form explicit in data structure

```
typedef struct treenode
{
 GLfloat m[16];
 void (*f)();
 struct treenode *sibling;
 struct treenode *child;
} treenode;
```

01/30/2003

15-462 Graphics I

26

## Initializing Tree Data Structure

- Initializing transformation matrix for node

```
treenode torso, head, ...;
/* in init function */
glLoadIdentity();
glRotatef(...);
glGetFloatv(GL_MODELVIEW_MATRIX, torso.m);
```

- Initializing pointers

```
torso.f = drawTorso;
torso.sibling = NULL;
torso.child = &head;
```

01/30/2003

15-462 Graphics I

27

## Generic Traversal

- Recursive definition

```
void traverse (treenode *root)
{
 if (root == NULL) return;
 glPushMatrix();
 glMultMatrixf(root->m);
 root->f();
 if (root->child != NULL) traverse(root->child);
 glPopMatrix();
 if (root->sibling != NULL) traverse(root->sibling);
}
```

- C is really not the right language for this

01/30/2003

15-462 Graphics I

28

## Outline

- Projections and Shadows
- Hierarchical Models
- Basic Animation

01/30/2003

15-462 Graphics I

29

## Unified View of Computer Animation

- Models with parameters
  - Polygon positions, control points, joint angles, ...
  - $n$  parameters define  $n$ -dimensional state space
- Animation defined by path through state space
  - Define initial state, repeat:
  - Render the image
  - Move to next point (following motion curves)
- Animation = specifying state space trajectory

01/30/2003

15-462 Graphics I

30

## Animation vs Modeling

- Modeling: what are the parameters?
- Animation: how do we vary the parameters?
- Sometimes boundary not clear
- Build models that are easy to control
- Hierarchical models often easy to control

01/30/2003

15-462 Graphics I

31

## Basic Animation Techniques

- Traditional (frame by frame)
- Keyframing
- Procedural techniques
- Behavioral techniques
- Performance-based (motion capture)
- Physically-based (dynamics)

01/30/2003

15-462 Graphics I

32

## Traditional Cel Animation

- Film runs at 24 frames per second (fps)
- Video at 30 frames per second
- Production process critical: render farms
- Artistic issues: story and style

01/30/2003

15-462 Graphics I

33

## Traditional Animation Process

- Story board: sequence of sketches with story
- Key frames
  - Important frames as line drawings
  - Motion-based description
  - Example: beginning of stride, end of stride
- Inbetweens: draw remaining frames
- Painting: redraw onto acetate cels, color them

01/30/2003

15-462 Graphics I

34

## Layered Motion

- Multiple layers of animation
  - Reuse background
  - Multiple parallel animators
  - Supported by transparent acetate for drawing
- Also used in computer animation
- Example: painters algorithm for hidden surface removal

01/30/2003

15-462 Graphics I

35

## Storyboard Examples [A Bug's Life]

01/30/2003

15-462 Graphics I

36

## Computer Assisted Animations

- Eliminate human labor, bottom to top
- Computerized cel painting
  - Digitize line drawing, color using seed fill
  - Widely used in production (e.g., Lion King)
- Cartoon inbetweening
  - Interpolate between two drawings (morphing)
  - Difficult to make look natural
  - Choice of parameters?
  - Rarely used in production

01/30/2003

15-462 Graphics I

37

## True Computer Animations

- Generate images by rendering a 3D model
- Vary parameters to produce animation
- Brute force
  - Manually set the parameters for every frame
  - 1440n values per minute for n parameters
  - Maintenance problem
- Computer keyframing
  - Lead animators create important frames
  - Computers draw inbetweens from 3D(!)
  - Dominant production method

01/30/2003

15-462 Graphics I

38

## Example: From Toy Story

01/30/2003

15-462 Graphics I

39

## Some Research Issues

- Inverse kinematics
  - How to plot a path through state space
  - Multiple degrees of freedom
  - Also important in robotics
- Physical accuracy
  - Collision detection
  - Computer graphics: only needs to look right
  - Simulation: must follow model correctly

01/30/2003

15-462 Graphics I

40

## Summary

- Projections and Shadows
- Hierarchical Models
- Basic Animation

01/30/2003

15-462 Graphics I

41

## Preview

- Tuesday – lighting and shading
- Assignment 2 out today
- Due in one week (Thursday, before lecture)

01/30/2003

15-462 Graphics I
